ScienceX

Battery Storage Market Notes, April 2026 issue

Science X Inc. Published November 5, 2026

The price of electricity changes with the time of day it is used. "Grid-scale battery storage" (large batteries connected to the power grid that store electricity and release it) earns money from that difference. These notes use published figures and our own records to show this month's movements in figures and tables. This issue is a back issue, made retroactively in November 2026. The grid connection study tally is as of the date it was made (October 19, 2026).

1. The three income streams of a battery storage site (how to read these notes)

A battery storage site (grid-scale battery storage) earns income from three markets. ① Wholesale electricity (JEPX) is a market where you buy and store electricity at cheap hours and sell it at expensive hours. ② The balancing market (EPRX) is a market where you sell grid operators the "capacity" to correct surpluses and shortages of electricity. ③ The capacity market (OCCTO) is a market where the country buys future electricity supply capacity in advance. These notes show the figures for these three markets in that order. The ①, ② or ③ at the start of each section title shows which market it is about.

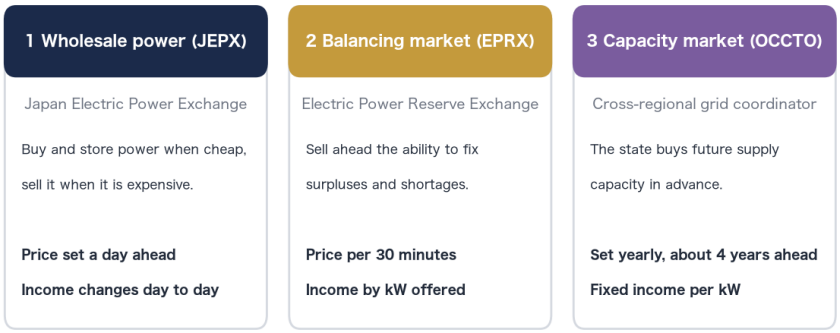

Figure 1 The three income streams of a battery storage site

Source: The rules of the Japan Electric Power Exchange (JEPX), the Electric Power Reserve Exchange (EPRX) and the Organization for Cross-regional Coordination of Transmission Operators (OCCTO).

2. Three movements this month

We picked three movements this month from the figures of the three markets.

- In wholesale electricity (JEPX), the monthly average spread between the most expensive 4 hours and the cheapest 4 hours in April 2026 was 23.12 yen/kWh in Tokyo and 13.02 yen/kWh in Kyushu.
- In the balancing market (EPRX), the bid ratio for Primary reserve (online) this month was 74.3%. No month since April 2025 has gone above 100%. The average awarded price was 4.27 yen/kW per 30 min.
- In the balancing market (EPRX), 60.2% of this month's sales for Tertiary reserve 2 came from the top 10% of 30-minute slots by sales.

3. ① Wholesale electricity (JEPX) | Average price

Wholesale electricity is electricity bought and sold between power companies and retailers. Its price is set on the "spot market" of the Japan Electric Power Exchange (JEPX), where electricity for the next day is bought and sold the day before. "System (nationwide)" is the price when all of Japan is treated as one market (the system price). When the transmission lines between regions are congested, prices split by area from Hokkaido to Kyushu (area prices).

The monthly average of the wholesale electricity (JEPX) System (nationwide) price was 14.77 yen/kWh in April 2026, against 9.82 yen/kWh in the same month last year.

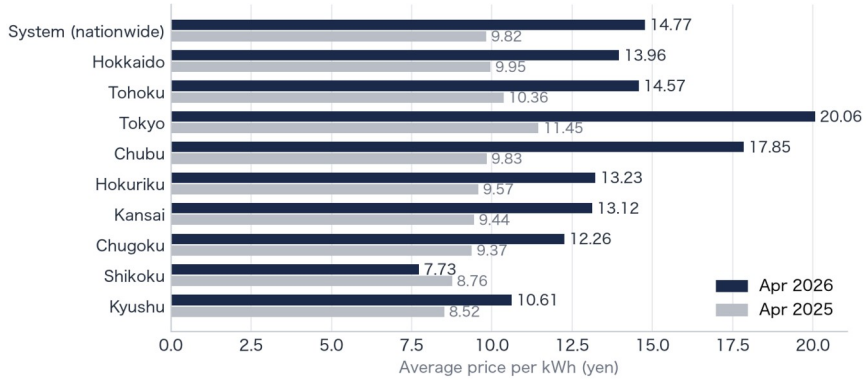

Figure 2 Average wholesale electricity price (yen/kWh). Navy is April 2026, grey is the same month last year

Source: Spot market trading results published by the Japan Electric Power Exchange (JEPX). Simple average of the 30-minute prices. Our tally.

4. ① Wholesale electricity (JEPX) | How the price moves during the day

The wholesale electricity price changes every 30 minutes. The figure shows the shape of one day, made by averaging the prices at the same time of day across the month. If a battery stores electricity at cheap hours and releases it at expensive hours, the difference becomes its income.

The daily trough and peak of wholesale electricity were 11.42 yen/kWh and 33.06 yen/kWh in Tokyo, and 3.50 yen/kWh and 17.19 yen/kWh in Kyushu. In both areas, the trough was around 12:30 and the peak was around 18:30.

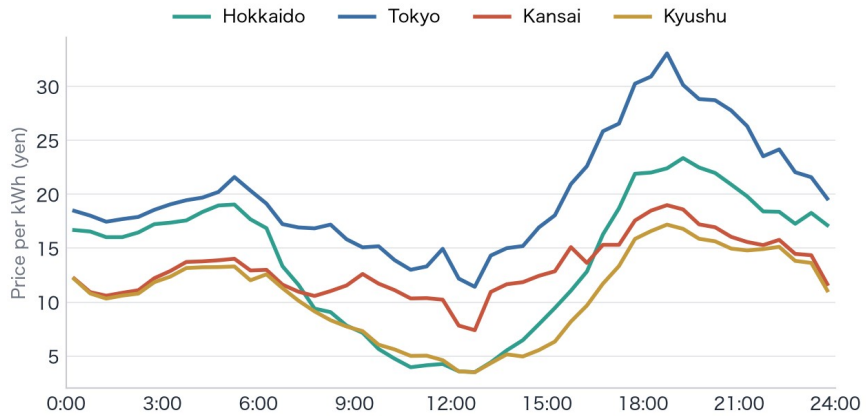

Figure 3 Daily peaks and troughs in the wholesale electricity price (April 2026 average, yen/kWh)

Source: JEPX spot market. Our tally.

© Science X Inc. · https://www.scix.co.jp

5. ① Wholesale electricity (JEPX) | How large is the spread per kWh

For each area, we took the average price of the most expensive 4 hours of each day, subtracted the average price of the cheapest 4 hours, and show the monthly average. This equals the difference per kWh if you buy 1 kWh during the cheapest 4 hours and sell it during the most expensive 4 hours. It is a simple difference. It does not subtract the electricity lost in charging and discharging or fees, and it ignores whether the cheap hours come before or after the expensive hours.

The area spread between the most expensive 4 hours and the cheapest 4 hours in wholesale electricity was largest in Tokyo at 23.12 yen/kWh and smallest in Shikoku at 9.41 yen/kWh.

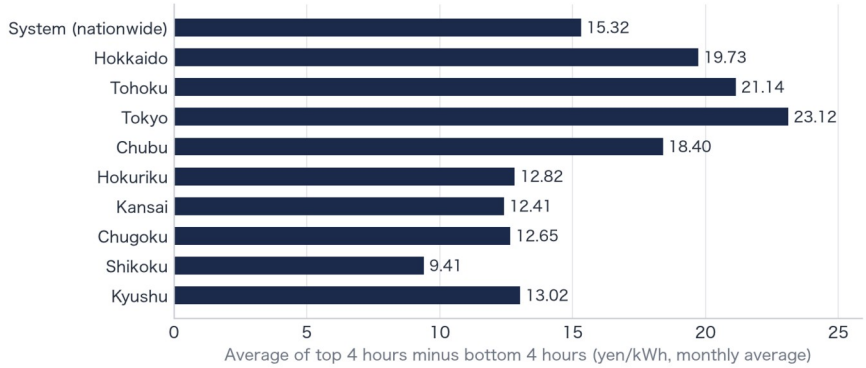

Figure 4 Wholesale electricity spread: average of the most expensive 4 hours − average of the cheapest 4 hours (April 2026, yen/kWh, monthly average)

Source: JEPX spot market. Our tally.

Area	2-hour spread (yen/kWh)	4-hour spread (yen/kWh)	Days with a 4-hour spread of 10 yen or more
System (nationwide)	16.89	15.32	24
Hokkaido	21.76	19.73	26
Tohoku	23.11	21.14	26
Tokyo	28.72	23.12	29
Chubu	20.67	18.40	27
Hokuriku	14.74	12.82	20
Kansai	14.29	12.41	20
Chugoku	14.31	12.65	20
Shikoku	10.82	9.41	11
Kyushu	14.07	13.02	21

The spread is the monthly average of the daily differences. April 2026 covers 30 days.

6. ① Wholesale electricity (JEPX) | There is a spread every day

We show the same 4-hour spread day by day. The larger the spread on a day, the more room a battery has to earn from it.

Of the 30 days, the wholesale electricity spread between the most expensive 4 hours and the cheapest 4 hours was 10 yen/kWh or more on 24 days for System (nationwide), 29 days in Tokyo and 11 days in Shikoku.

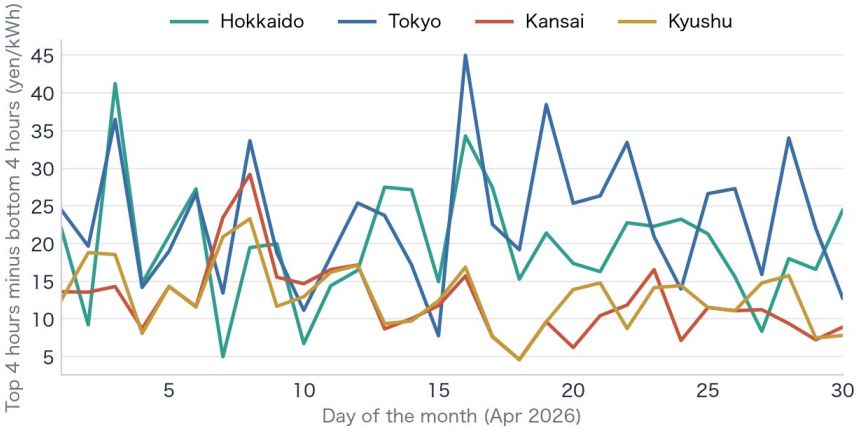

Figure 5 Daily wholesale electricity spread (average of that day's most expensive 4 hours − average of the cheapest 4 hours, yen/kWh)

Source: JEPX spot market. Our tally.

7. ② Balancing market (EPRX) | Seven products, and prices by area

The balancing market is a market where grid operators buy, every 30 minutes, the "capacity" to correct surpluses and shortages of electricity. The products are divided by how fast output changes after an instruction. Primary reserve is the fastest, and Tertiary reserve 2 is the slowest. Primary reserve has two categories: "online", connected to the grid operator by a dedicated line, and "offline", which runs on the simplified dispatch system without a dedicated line. They are tendered and traded separately, so we show them separately. A Composite product is a bid that offers several products together. The price is set in yen per 1 kW of capacity offered per 30 minutes. The figure shows the range of awarded prices by area (by the area where the power source is located). The thin line runs from the cheapest bid to the most expensive bid in the month. The thick band is the price range that contains 8 out of 10 of the 30-minute slots with awards. The dot is the average awarded price. Nationwide figures are in the table in the "Market figures" section.

By the area where the power source is located, the highest average awarded price in the balancing market was 14.57 yen for Primary reserve (offline) in Chubu, and the lowest was 0.37 yen for Tertiary reserve 2 in Shikoku (yen/kW per 30 min).

Figure 6 Range and average of awarded prices in the balancing market by area (April 2026 (1st to 30th), by area where the power source is located)

Source: Trading results (preliminary figures) published by the Electric Power Reserve Exchange (EPRX). Our tally.

Product	Time from instruction to output change	Duration
Primary reserve (online)	Within 10 seconds	5 minutes or more
Primary reserve (offline)	Within 10 seconds	5 minutes or more
Secondary reserve 1	Within 5 minutes	30 minutes
Secondary reserve 2	Within 5 minutes	30 minutes
Tertiary reserve 1	Within 15 minutes	30 minutes
Tertiary reserve 2	Within 60 minutes	30 minutes
Composite product	Requirements of the combined products	Requirements of the combined products

8. ② Balancing market (EPRX) | Grid areas and times where bids are more likely to win

The award rate is the share of the bid volume that was awarded. The higher it is, the more likely a bid is to win. The figure shows, for each grid area (the area where the power source is located), the award rate of each product by time of day (every 30 minutes). Where a line breaks, there were no bids at that time.

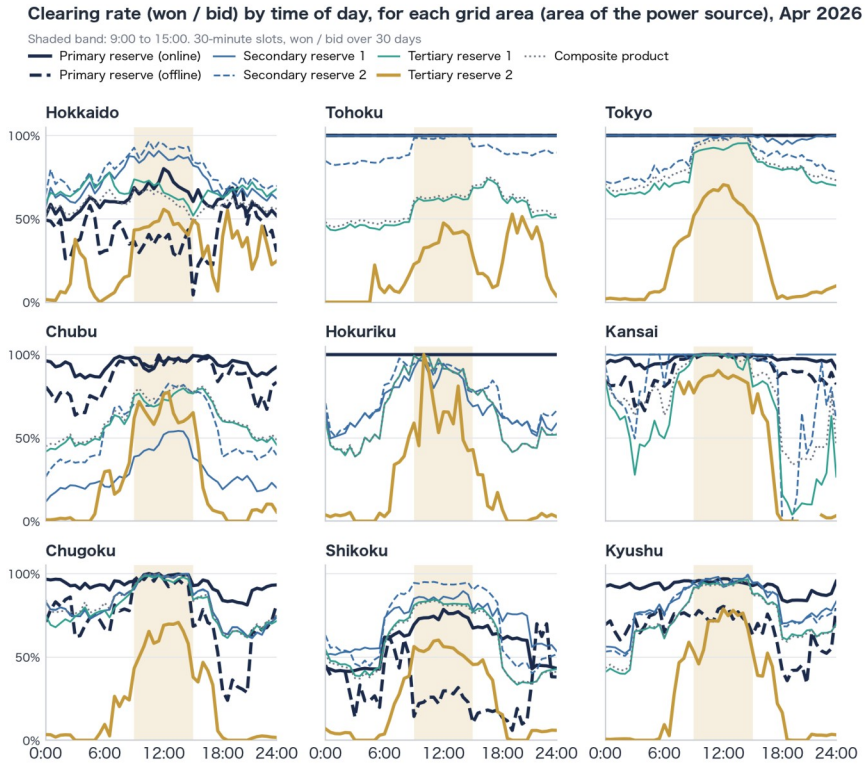

Figure 7 Award rate in the balancing market (grid area (area where the power source is located) × time of day, April 2026 (1st to 30th))

Source: Trading results (preliminary figures) published by the Electric Power Reserve Exchange (EPRX). Our tally.

9. ② Balancing market (EPRX) | How full are the Primary reserve seats

Primary reserve is the fastest product. It changes output within 10 seconds of an instruction, and batteries are often used for it. The left side shows the online category and the right side the offline category. The bars show the bid ratio (bid volume ÷ volume the grid operators asked for). Above 100%, more bids came in than were asked for, and some bids lose. The line shows the average awarded price. These are monthly figures we have from April 2025. Figures for Primary reserve (offline) start in April 2026.

In the balancing market, Primary reserve (online) had a bid ratio of 74.3% (no month above 100% yet) and an average awarded price of 4.27 yen. Primary reserve (offline) had 30.9% and 12.29 yen (yen/kW per 30 min).

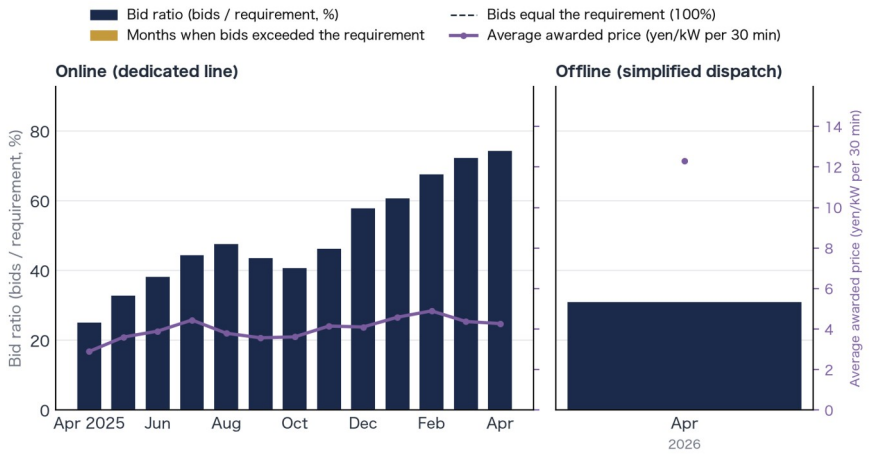

Figure 8 Primary reserve bid ratio (bars) and average awarded price (line) (monthly. Left is online, right is offline. Gold bars are months when bids exceeded the volume asked for)

Source: Trading results (preliminary figures) published by the Electric Power Reserve Exchange (EPRX). Our tally.

10. ② Balancing market (EPRX) | How each product's price has moved

These are the average awarded prices of each product from April 2025 (monthly averages weighted by awarded volume). Figures for Primary reserve (offline) start in April 2026. From March 14, 2026, Primary reserve through Tertiary reserve 1 and the Composite product changed from trading in 3-hour blocks to trading every 30 minutes (Tertiary reserve 2 was already every 30 minutes).

The average awarded price of Primary reserve (online) in the balancing market went from 2.89 yen in April 2025 to 4.27 yen this month. The highest was 4.90 yen in February 2026 (yen/kW per 30 min).

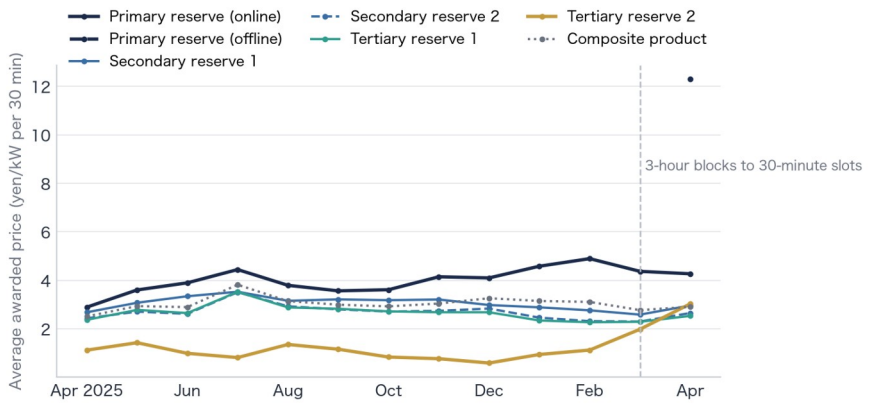

Figure 9 Average awarded price of each product in the balancing market (yen/kW per 30 min, monthly)

Source: Trading results (preliminary figures) published by the Electric Power Reserve Exchange (EPRX). Our tally.

11. ② Balancing market (EPRX) | Which hours of the day are expensive

These are the hourly average awarded prices of each product for April 2026 (1st to 30th).

The average awarded price of Primary reserve (online) in the balancing market was highest around 18:00 at 5.37 yen and lowest around 0:00 at 3.17 yen (yen/kW per 30 min).

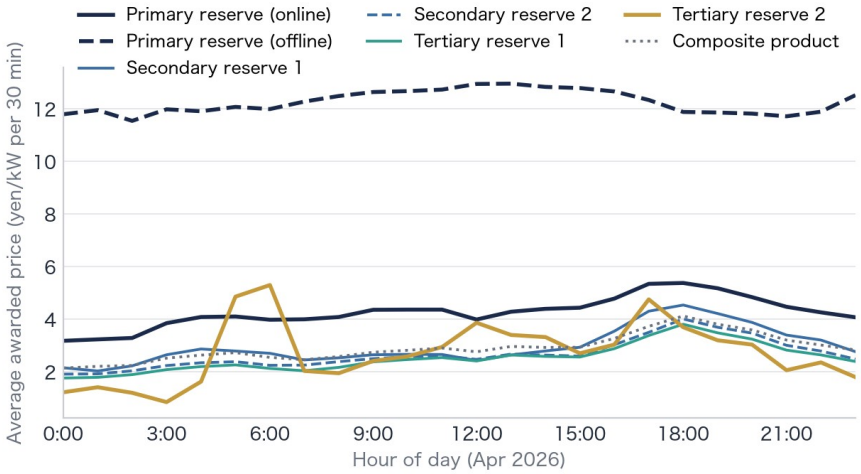

Figure 10 Average awarded price by time of day in the balancing market (April 2026 (1st to 30th), yen/kW per 30 min)

Source: Trading results (preliminary figures) published by the Electric Power Reserve Exchange (EPRX). Our tally.

12. ② Balancing market (EPRX) | Which products batteries are used for

The figure shows the share of the awarded volume held by batteries. The table compares the average awarded price of the volume won by batteries with the average awarded price of the whole product.

In the balancing market, batteries held 22.0% of Primary reserve (online). The average awarded price of the volume won by batteries was 9.02 yen, against 4.27 yen overall (yen/kW per 30 min).

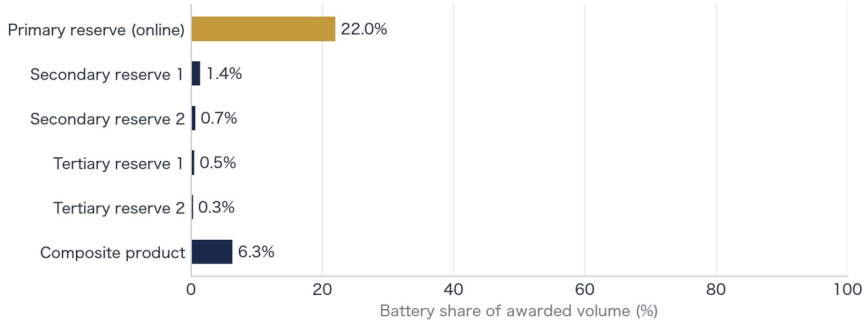

Figure 11 Share held by batteries in the balancing market (%)

Source: Trading results (preliminary figures) by power source type published by the Electric Power Reserve Exchange (EPRX). Our tally.

Product	Volume won by batteries (yen/kW per 30 min)	Whole product (yen/kW per 30 min)
Primary reserve (online)	9.02	4.27
Secondary reserve 1	9.54	2.96
Secondary reserve 2	9.91	2.65
Tertiary reserve 1	9.46	2.53
Tertiary reserve 2	46.42	3.03
Composite product	9.00	2.91

Both are averages weighted by awarded volume (April 2026, preliminary figures, nationwide). For Tertiary reserve 2, batteries hold only 0.3% of the awarded volume, and most of it was won in high-priced 30-minute slots, so their average comes out high. Primary reserve (offline) is not in this table or the figure, because we have not included the published figures by power source type in our tally.

13. ② Balancing market (EPRX) | Sales concentrate in a small number of slots

We ranked the month's 30-minute slots with awards by sales (average awarded price × awarded volume, nationwide), from highest to lowest. For each product, the figure shows what % of the month's sales the top slots account for. The more a curve bulges above the dotted line, the more sales are concentrated in a few slots. Tertiary reserve 2 is a product that covers errors in forecasting renewable output due to weather. Its price is low in most slots and high in only a few.

In the balancing market, the share of sales in the top 10% of slots was 60.2% for Tertiary reserve 2 and 16.0% for Primary reserve (online).

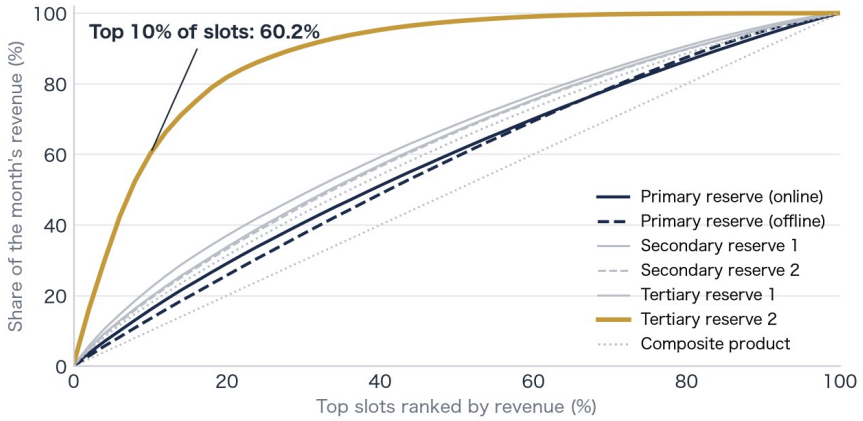

Figure 12 Share of balancing market sales concentrated in the top slots (April 2026 (1st to 30th), nationwide)

Source: Trading results (preliminary figures) published by the Electric Power Reserve Exchange (EPRX). Our tally.

In April 2026, of the 1,259 30-minute slots with awards, the top 1% by sales (average awarded price × awarded volume) accounted for 8.3% of the month's sales. There were 72 slots with a nationwide average awarded price of 10 yen/kW per 30 min or more, and 181 slots with no awards.

Slots with the highest maximum awarded prices (by area where the power source is located):

Date	Time	Area	Highest awarded price (yen/kW per 30 min)
April 1	14:30	Chubu	200.00
April 2	11:30	Chubu	200.00
April 2	12:00	Chubu	200.00
April 2	13:00	Chubu	200.00
April 2	13:30	Chubu	200.00

Source: Tertiary reserve 2 trading results (preliminary figures) published by the Electric Power Reserve Exchange (EPRX). Our tally.

14. ③ Capacity market (OCCTO) | A market that buys future supply capacity

The capacity market buys electricity supply capacity four years ahead through an auction held once a year. The price is set in yen per kW per year. The left figure shows the clearing prices of past main auctions. The right figure shows the battery and pumped hydro capacity contracted in the Long-Term Decarbonization Power Source Auction (a separate auction that supports new builds such as batteries and pumped hydro). These are published once a year, so they do not change every month. The latest is for delivery FY2029 (published January 2026).

The capacity market clearing price (Tokyo) was 14,137 yen/kW for delivery FY2024, 3,495 yen/kW for FY2025 and 15,111 yen/kW for FY2029. In the Long-Term Decarbonization Power Source Auction, batteries and pumped hydro in the FY2025 auction were 819 MW lithium-ion and 886 MW non-lithium. All are the latest figures from the once-a-year publications.

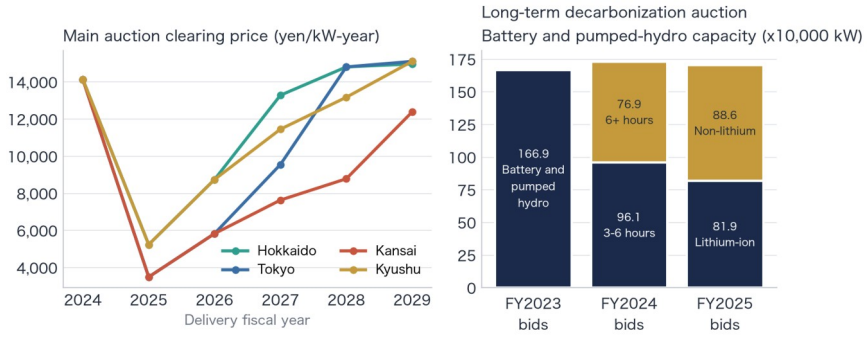

Figure 13 Capacity market clearing prices (left, yen/kW) and contracted battery and pumped hydro capacity in the Long-Term Decarbonization Power Source Auction (right, in units of 10,000 kW)

Source: Clearing results and capacity contract documents published by the Organization for Cross-regional Coordination of Transmission Operators (OCCTO) (sources in the last section (Assumptions and terms)). As published.

15. Our records | Where battery storage projects are growing

We have no records for this month, because it was before we started DealRoom (our data room for buyers), which began in May 2026.

16. Our records | How many months and how much it costs to connect to the grid

A grid connection study is a procedure in which the grid operator checks "whether this site can be connected and how much the work will cost." The grid connection cost contribution is the part of the connection work cost paid by the applicant. Of the response letters we received, we tallied only the high-voltage ones (connections to 6,600V distribution lines) by grid area. Extra-high voltage is not included. Grid areas with fewer than 5 cases are not shown.

The medians of grid connection study responses (high voltage only) were a construction period of 8.0 months in Tokyo and 17.0 months in Tohoku, and a grid connection cost contribution of ¥3.02 million in Tokyo and ¥32.35 million in Tohoku. These figures are separate from wholesale electricity and the balancing market.

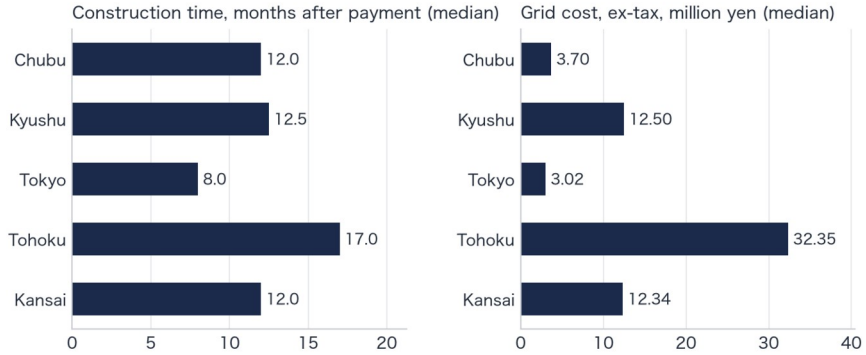

Figure 15 Median grid connection study responses (high voltage) by grid area (left: months of construction, right: grid connection cost contribution, excluding tax)

Source: Tally of the high-voltage grid connection study response letters we received from general transmission and distribution operators (as of October 19, 2026).

17. Market figures (tables ready to use in your materials)

We put the numbers behind the figures in the text into tables you can use in your materials: ① wholesale electricity (JEPX) figures by area and trading volume, ② nationwide balancing market figures by product (bid ratio, award rate, price, battery share), and ③ capacity market clearing prices.

Wholesale electricity, JEPX spot market (April 2026, by area, yen/kWh)

Area	Monthly average	Same month last year	Daytime (8:00–16:00)	Evening (16:00–20:00)	4-hour spread	Highest	30-minute slots at 30 yen or more	30-minute slots at 0.01 yen
System (nationwide)	14.77	9.82	9.20	20.31	15.32	35.00	21	89
Hokkaido	13.96	9.95	6.18	20.00	19.73	50.00	37	184
Tohoku	14.57	10.36	6.37	21.08	21.14	50.00	54	184
Tokyo	20.06	11.45	15.16	28.53	23.12	64.28	159	28
Chubu	17.85	9.83	12.88	22.72	18.40	44.70	92	58
Hokuriku	13.23	9.57	11.47	17.00	12.82	44.70	32	60
Kansai	13.12	9.44	11.19	16.89	12.41	37.54	22	61
Chugoku	12.26	9.37	9.18	15.86	12.65	37.54	7	82
Shikoku	7.73	8.76	4.79	8.99	9.41	31.03	2	169
Kyushu	10.61	8.52	5.71	14.63	13.02	35.00	1	180

Trading volume (April 2026, total for 30 days): total contracted volume 27,138 million kWh (same month last year 20,785 million kWh), sell bid volume 44,311 million kWh, buy bid volume 33,363 million kWh.

Source: Spot market trading results published by the Japan Electric Power Exchange (JEPX). Prices are simple averages of the 30-minute slots. Our tally.

ScienceX

Balancing market (April 2026, preliminary figures, nationwide)

Product	Volume asked for (MW)	Bid volume (MW)	Awarded volume (MW)	Bid ratio (bids ÷ asked for)	Award rate (awarded ÷ bids)	Average awarded price (yen/kW per 30 min)	Battery share
Primary reserve (online)	1,598.4	1,187.4	1,041.7	74.3%	87.7%	4.27	22.0%
Primary reserve (offline)	500.6	154.8	132.3	30.9%	85.5%	12.29	—
Secondary reserve 1	1,385.2	2,046.6	1,226.1	147.7%	59.9%	2.96	1.4%
Secondary reserve 2	1,452.3	3,098.5	2,306.9	213.3%	74.5%	2.65	0.7%
Tertiary reserve 1	3,446.8	4,956.2	3,381.0	143.8%	68.2%	2.53	0.5%
Tertiary reserve 2	861.7	1,926.8	793.2	223.6%	41.2%	3.03	0.3%
Composite product	4,276.4	5,259.2	3,681.3	123.0%	70.0%	2.91	6.3%

Volumes are averages per 30-minute slot. A product with a bid ratio below 100% did not get enough bids for the volume asked for. The award rate is the share of the bid volume that was awarded. The battery share for Primary reserve (offline) is "—", because we have not included the published figures by power source type in our tally.

Source: Trading results (preliminary figures) and trading results by power source type published by the Electric Power Reserve Exchange (EPRX). Our tally.

18. Assumptions and terms

- The figures are our tally of the values published by the sources. We have not added up several months or converted anything to annual figures. We do not show the revenue of any single battery storage site.
- Months covered: wholesale electricity (JEPX) is April 2026 (30 days), and the balancing market (EPRX) is the April 2026 preliminary figures (delivery dates up to the 30th). For the balancing market, the month differs until the published figures for April 2026 are included in our tally.
- Average prices are simple averages of the 30-minute slots (not weighted by trading volume). Daytime is the slots from 8:00 to 16:00, and evening is the slots from 16:00 to 20:00.
- Spread: we sort the day's 30-minute slots by price and subtract the average of the 8 cheapest slots from the average of the 8 most expensive slots (4 hours) (4 slots for 2 hours). We do not consider whether the cheap hours come before or after the expensive hours, the electricity lost in charging and discharging, or fees, taxes and transmission charges. This does not show actual revenue.
- Balancing market: EPRX preliminary figures, nationwide (the total column). The volume asked for is by grid operator (TSO). Bid volume, awarded volume and average awarded price are by the area where the power source is located. Volumes are averages per 30-minute slot. The average awarded price is weighted by awarded volume. Bid ratio = bid volume ÷ volume asked for. Award rate = awarded volume ÷ bid volume. For the 3-hour blocks up to March 13, 2026, we counted 1 block as six 30-minute slots.
- Range of awarded prices: the thin line runs from the cheapest bid (lowest awarded price) to the most expensive bid (highest awarded price) among the month's 30-minute slots with awards (published values by area where the power source is located). The published values for Primary reserve (online), Secondary reserve 1 and 2, and Tertiary reserve 1 also include Composite product bids (one price for several products together). So we removed from the thin line any bid above the price cap of 15 yen for Primary reserve (online) and Secondary reserve 1 (for delivery up to August 31, 2026), or above 10 yen for Secondary reserve 2 and Tertiary reserve 1, that can be explained by a Composite product bid in the same 30-minute slot and area. For Primary reserve (offline), we removed from the thin line any bid above the price cap (15 yen this month). (The balancing market system also awards bids above the cap and lowers them to the cap at settlement.) The thick band is the range from the bottom 10% to 90% when the average awarded prices of the 30-minute slots with awards are sorted from cheapest. The dot is the average weighted by awarded volume.
- Award rate by grid area × time of day: total awarded volume ÷ total bid volume for the slots at the same time of day in the month (by area where the power source is located).
- The time from instruction to output change and the duration for each balancing market product are the FY2026 specifications. For Primary reserve, the online category is connected to the grid operator by a dedicated line, and the offline category runs on the simplified dispatch system without a dedicated line.
- High-priced Tertiary reserve 2 slots: 30-minute slots with a nationwide average awarded price of 10 yen/kW per 30 min or more. The top 1% is the top 1% of slots ranked by sales (average awarded price × awarded volume). The highest awarded price is the published value by area where the power source is located.

Sources (OCCTO, Long-Term Decarbonization Power Source Auction): FY2023 auction https://www.occto.or.jp/assets/260605_auction_keiyakujyoukyou_kouhyou.pdf / FY2024 auction https://www.occto.or.jp/market-board/market/jitsujukyukanren/files/longauction_keiyakukekka_2024.pdf / FY2025 auction https://www.occto.or.jp/assets/various/capacity-market/jitsujukyukanren/yoryokakuhokeiyaku/longauction_keiyakukekka_2025.pdf

- Capacity market clearing results are published in a different year for each delivery fiscal year (the FY2024 results in 2020, the FY2029 results in January 2026). We do not show the number of battery projects in the Long-Term Decarbonization Power Source Auction, because it is not in the published summary tables.

Sources: Japan Electric Power Exchange (JEPX) spot market trading results / Electric Power Reserve Exchange (EPRX) trading results (preliminary figures) and trading results by power source type / Organization for Cross-regional Coordination of Transmission Operators (OCCTO) capacity market main auction clearing results and Long-Term Decarbonization Power Source Auction capacity contract documents / our tally of the grid connection study response letters we received / our DealRoom records.

Terms: System price (System (nationwide)) = the wholesale electricity price when all of Japan is treated as one market. Area price = the price that splits by area depending on how congested the transmission lines are. The grid = the power companies' transmission

network. Grid connection = connecting to the transmission network. MW = the size of electric power (1MW = 1,000kW). MWh = the amount of electricity that can be stored. yen/kWh = the price per 1 kWh of electricity.
