ScienceX

Battery Storage Market Notes, May 2026 issue

Science X Inc. Published November 5, 2026

The price of electricity changes with the time of day. Grid-scale battery storage (large batteries connected to the grid that store electricity and release it) earns money from that difference. These notes use published figures and our own records to show this month's trends in figures and tables. This issue is a back issue, produced in November 2026 for an earlier month. The grid connection study figures are as of the date we produced it (October 19, 2026).

1. The 3 income sources of a battery storage plant (how to read these notes)

A battery storage plant (grid-scale battery storage) earns income from 3 markets. ① Wholesale electricity (JEPX) is the market where you buy and store electricity when it is cheap and sell it when it is expensive. ② The balancing market (EPRX) is the market where you sell grid operators the "capacity" to correct surpluses and shortages of electricity. ③ The capacity market (OCCTO) is the market where the country buys future electricity supply capacity in advance. These notes present the figures in the order of these 3 markets. The ①, ② or ③ at the start of each section title shows which market it covers.

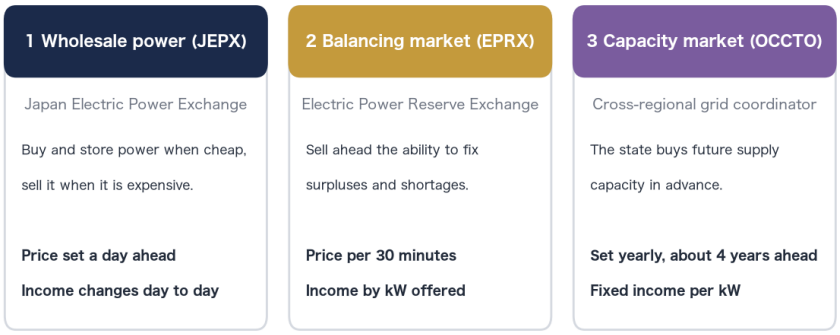

Figure 1 The 3 income sources of a battery storage plant

Source: Rules of the Japan Electric Power Exchange (JEPX), the Electric Power Reserve Exchange (EPRX) and the Organization for Cross-regional Coordination of Transmission Operators (OCCTO).

2. 3 trends this month

From the figures for the 3 markets, we picked 3 trends this month.

- In wholesale electricity (JEPX), the monthly average spread between the average of the 4 highest-priced hours and the average of the 4 lowest-priced hours in May 2026 was 18.00 yen/kWh in Tokyo and 16.64 yen/kWh in Kyushu.
- In the balancing market (EPRX), the bid ratio for Primary reserve (online) this month was 71.0%. No month since April 2025 has yet exceeded 100%. The average awarded price was 4.84 yen/kW per 30 min.
- In the balancing market (EPRX), the top 10% of 30-minute slots accounted for 54.2% of the month's revenue for Tertiary reserve 2.

3. ① Wholesale electricity (JEPX) | Average price

Wholesale electricity is electricity that power companies and retailers buy and sell among themselves. Its price is set on the "spot market" of the Japan Electric Power Exchange (JEPX), a market where electricity for the next day is traded the day before. "System (nationwide)" is the price when all of Japan is treated as a single market (the system price). When the power lines between regions are congested, the price splits into a separate price for each area from Hokkaido to Kyushu (the area price).

The monthly average wholesale price for System (nationwide) was 14.06 yen/kWh in May 2026, against 8.92 yen/kWh in the same month last year (a difference of 5.14 yen).

Figure 2 Average wholesale electricity price (yen/kWh). Navy is May 2026, grey is the same month last year

Source: Spot market trading results published by the Japan Electric Power Exchange (JEPX). Simple average of 30-minute prices. Our own aggregation.

4. ① Wholesale electricity (JEPX) | How the price moves through the day

The wholesale electricity price changes every 30 minutes. The figure shows the shape of one day, averaging the prices at the same time of day across the month. If a battery stores electricity when it is cheap and releases it when it is expensive, the difference becomes the battery's income.

The daily low and high of wholesale electricity were 9.96 yen/kWh around 7:00 and 28.79 yen/kWh around 18:30 in Tokyo, and 1.46 yen/kWh around 12:00 and 19.98 yen/kWh around 18:30 in Kyushu.

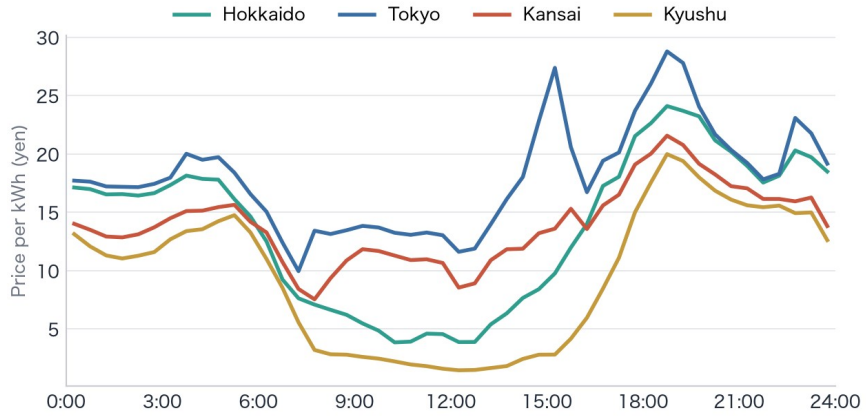

Figure 3 Daily peaks and troughs of the wholesale electricity price (average for May 2026, yen/kWh)

Source: JEPX spot market. Our own aggregation.

© Science X Inc. · https://www.scix.co.jp

5. ① Wholesale electricity (JEPX) | How large is the spread per kWh

For each area, we took the average price of the day's 4 highest-priced hours, subtracted the average price of the 4 lowest-priced hours, and show the monthly average. This equals the difference per kWh if you buy 1 kWh in the 4 cheapest hours and sell it in the 4 most expensive hours. It is a simple difference: it does not subtract electricity lost in charging and discharging or fees, and it ignores the order of the cheap and expensive hours.

By area, the monthly average 4-hour wholesale spread was largest in Tohoku at 21.14 yen/kWh and smallest in Shikoku at 12.97 yen/kWh.

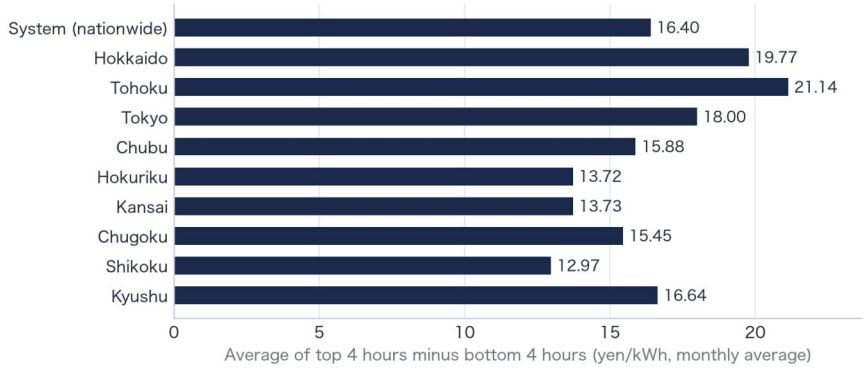

Figure 4 Wholesale electricity spread: average of the 4 highest hours − average of the 4 lowest hours (May 2026, yen/kWh, monthly average)

Source: JEPX spot market. Our own aggregation.

Area	2-hour spread (yen/kWh)	4-hour spread (yen/kWh)	Days with a 4-hour spread of 10 yen or more
System (nationwide)	18.41	16.40	27
Hokkaido	22.00	19.77	31
Tohoku	23.55	21.14	31
Tokyo	21.89	18.00	29
Chubu	17.99	15.88	26
Hokuriku	15.80	13.72	23
Kansai	15.80	13.73	23
Chugoku	17.32	15.45	26
Shikoku	14.77	12.97	21
Kyushu	17.98	16.64	28

The spread is the monthly average of the daily spreads. May 2026 covers 31 days.

6. ① Wholesale electricity (JEPX) | There is a spread every day

We show the same 4-hour spread day by day. The larger the spread on a given day, the more room a battery has to earn from it.

For System (nationwide) wholesale electricity, the 4-hour spread was 10 yen/kWh or more on 27 of 31 days, and in Hokkaido and Tohoku on 31 of 31 days.

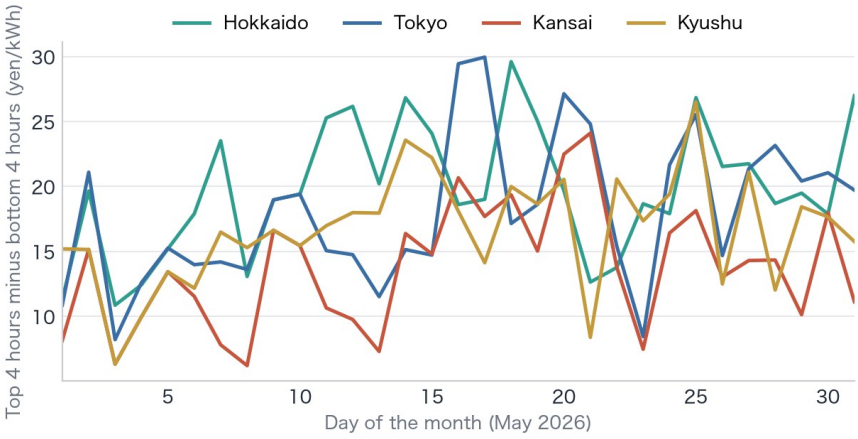

Figure 5 Daily wholesale electricity spread (average of the day's 4 highest hours − average of the 4 lowest hours, yen/kWh)

Source: JEPX spot market. Our own aggregation.

7. ② Balancing market (EPRX) | 7 products, and prices by area

The balancing market is a market where grid operators buy, every 30 minutes, the "capacity" to correct surpluses and shortages of electricity. Products differ by how quickly output must change after an instruction. Primary reserve is the fastest and Tertiary reserve 2 is the slowest. Primary reserve has 2 categories: "online", connected to the grid operator by a dedicated line, and "offline", which runs on the simplified dispatch system without a dedicated line. They are tendered and traded separately, so we show them separately. A Composite product is a bid that offers several products together. The price is set in yen per 1 kW of capacity offered per 30 minutes. The figure shows the range of awarded prices by area (by the area where the resource is located). The thin line runs from the lowest to the highest awarded bid in the month, the thick band is the price range that contains 8 out of 10 of the 30-minute slots with awards, and the dot is the average awarded price. Nationwide figures are in the table in the section "Market figures".

By area, the highest average awarded price in the balancing market was 13.00 yen/kW per 30 min for Tertiary reserve 2 in Tokyo, and the lowest was 0.33 yen/kW per 30 min, also for Tertiary reserve 2, in Shikoku.

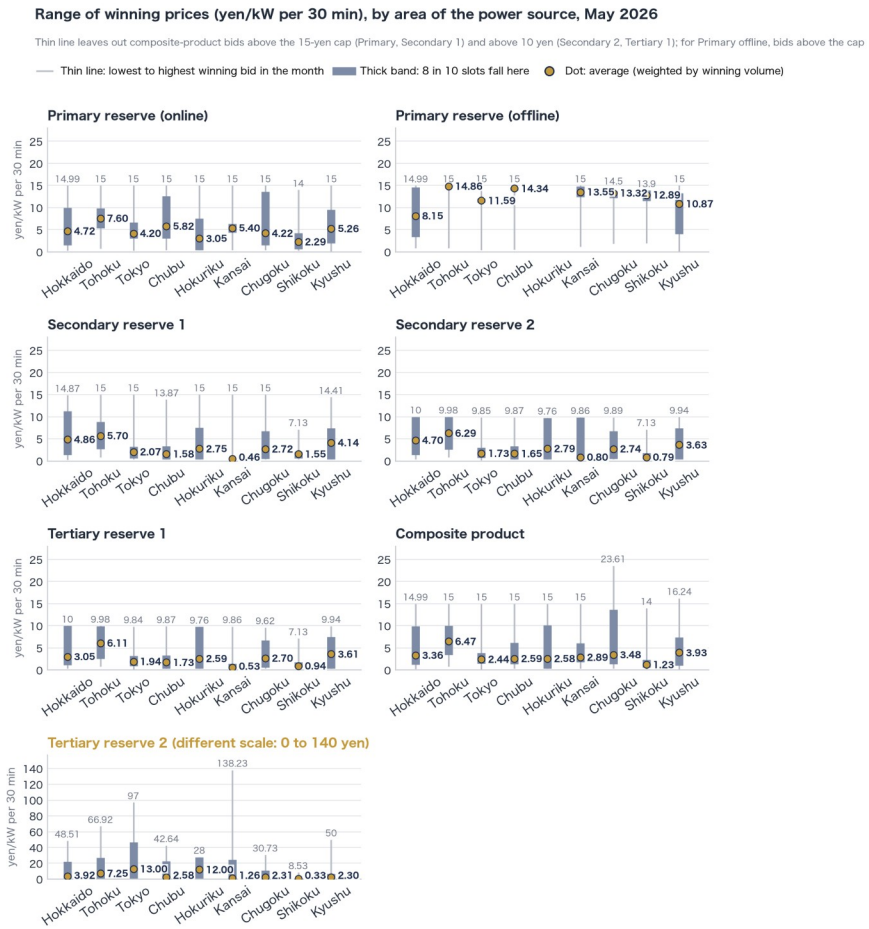

Figure 6 Range and average of awarded prices by area in the balancing market (May 2026 (1st to 31st), by the area where the resource is located)

Source: Trading results (preliminary figures) published by the Electric Power Reserve Exchange (EPRX). Our own aggregation.

Product	Time from instruction to output change	Duration
Primary reserve (online)	Within 10 seconds	5 minutes or more
Primary reserve (offline)	Within 10 seconds	5 minutes or more
Secondary reserve 1	Within 5 minutes	30 minutes
Secondary reserve 2	Within 5 minutes	30 minutes
Tertiary reserve 1	Within 15 minutes	30 minutes
Tertiary reserve 2	Within 60 minutes	30 minutes
Composite product	Requirements of the combined products	Requirements of the combined products

8. ② Balancing market (EPRX) | Grid areas and times where bids win more easily

The award rate is the share of the offered volume that was awarded. The higher it is, the more easily bids win. The figure shows the award rate for each product by time of day (every 30 minutes), for each grid area (the area where the resource is located). Where a line is broken, there were no offers at that time.

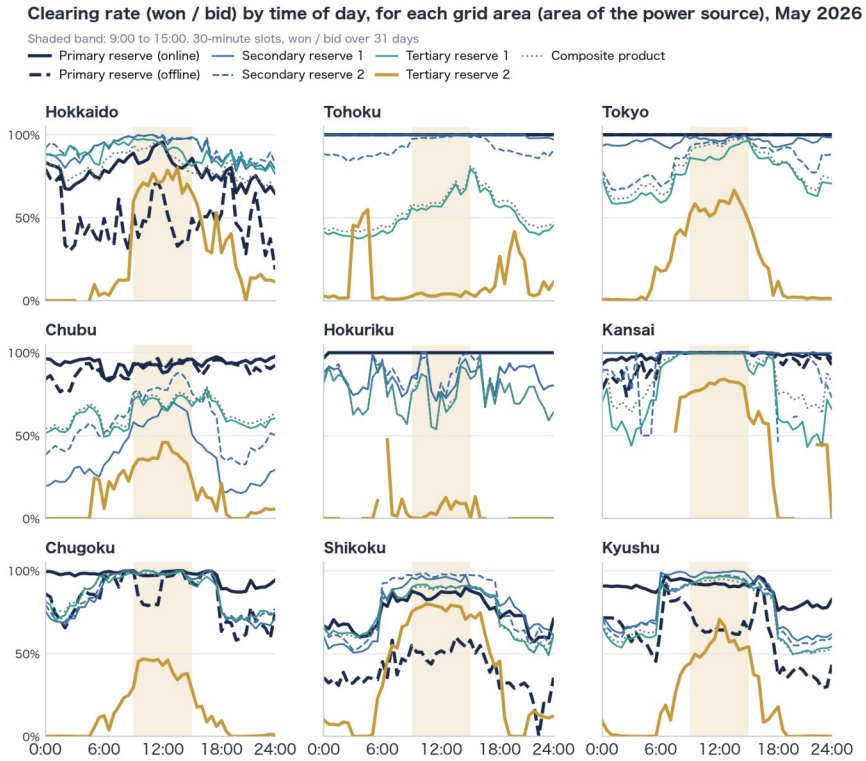

Figure 7 Award rate in the balancing market (grid area (area where the resource is located) × time of day, May 2026 (1st to 31st))

Source: Trading results (preliminary figures) published by the Electric Power Reserve Exchange (EPRX). Our own aggregation.

9. ② Balancing market (EPRX) | How full are the seats for Primary reserve

Primary reserve is the fastest product, changing output within 10 seconds of an instruction, and batteries are often used for it. The left side is the online category and the right side is the offline category. The bars show the bid ratio (volume offered ÷ volume requested by grid operators). Above 100%, more bids come in than the volume requested, and some bids lose. The line shows the average awarded price. These are monthly figures from April 2025, the data we have. Primary reserve (offline) figures start in April 2026.

In the balancing market, the bid ratio and average awarded price (yen/kW per 30 min) were 71.0% and 4.84 yen for Primary reserve (online), with no month above 100% yet, and 40.4% and 12.53 yen for Primary reserve (offline).

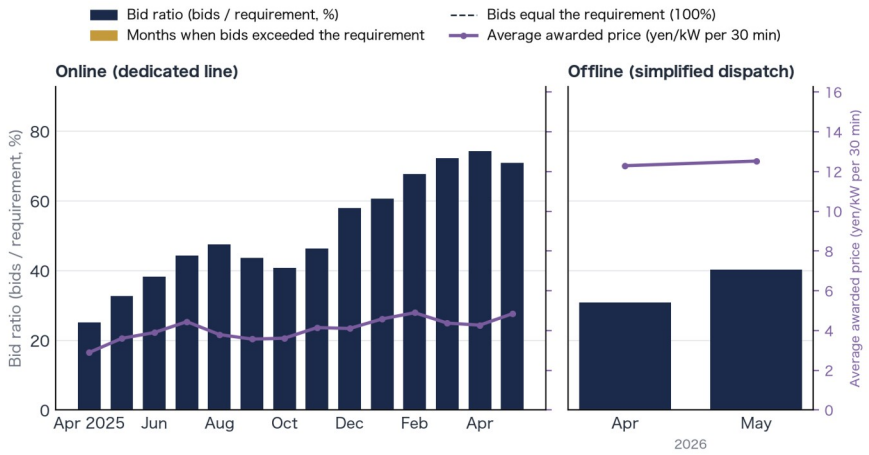

Figure 8 Bid ratio (bars) and average awarded price (line) for Primary reserve (monthly; left is online, right is offline; gold bars are months when offers exceeded the volume requested)

Source: Trading results (preliminary figures) published by the Electric Power Reserve Exchange (EPRX). Our own aggregation.

10. ② Balancing market (EPRX) | How each product's price has moved

These are the average awarded prices for each product since April 2025 (monthly averages weighted by awarded volume). Primary reserve (offline) figures start in April 2026. From March 14, 2026, Primary to Tertiary reserve 1 and the Composite product changed from trading in 3-hour blocks to trading every 30 minutes (Tertiary reserve 2 was already traded every 30 minutes).

In the balancing market, the average awarded price (yen/kW per 30 min) for Tertiary reserve 2 went from 1.12 yen in April 2025 to 4.18 yen this month, the highest so far. For the Composite product it went from 2.51 yen to 3.07 yen, and the highest was 3.82 yen in July 2025.

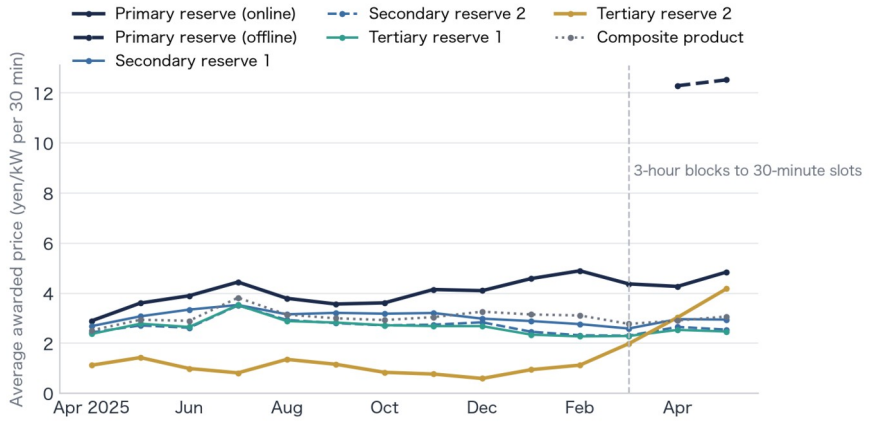

Figure 9 Average awarded price by product in the balancing market (yen/kW per 30 min, monthly)

Source: Trading results (preliminary figures) published by the Electric Power Reserve Exchange (EPRX). Our own aggregation.

11. ② Balancing market (EPRX) | Which hours of the day are expensive

These are the hourly average awarded prices for each product in May 2026 (1st to 31st).

In the balancing market, the average awarded price for Tertiary reserve 2 was highest in the 5:00 hour at 14.57 yen/kW per 30 min, and lowest in the 2:00 hour at 0.64 yen/kW per 30 min.

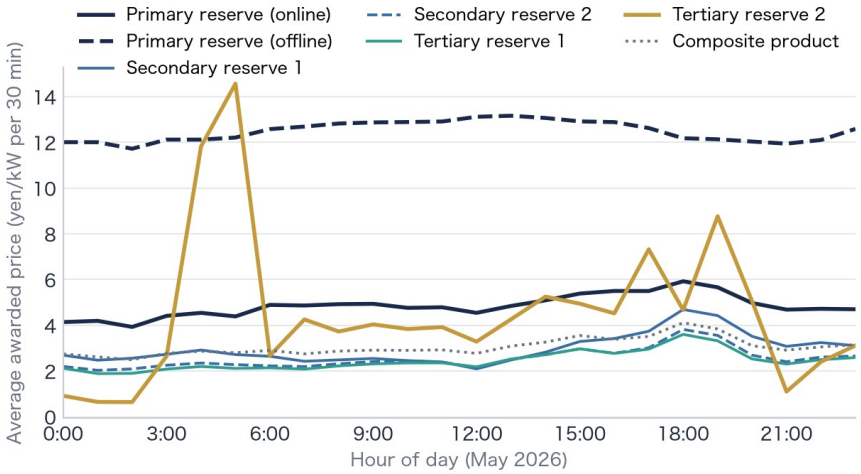

Figure 10 Average awarded price by time of day in the balancing market (May 2026 (1st to 31st), yen/kW per 30 min)

Source: Trading results (preliminary figures) published by the Electric Power Reserve Exchange (EPRX). Our own aggregation.

12. ② Balancing market (EPRX) | In which products are batteries used

The figure shows the share of awarded volume taken by batteries. The table compares the average awarded price of the volume won by batteries with the average awarded price for the product as a whole.

In the balancing market, batteries had a 28.2% share of Primary reserve (online), and the average awarded price of the volume they won was 9.83 yen/kW per 30 min (4.84 yen overall).

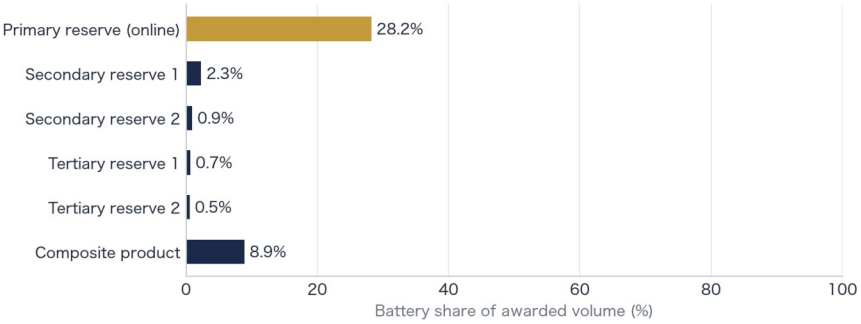

Figure 11 Share of batteries in the balancing market (%)

Source: Trading results (preliminary figures) by resource type published by the Electric Power Reserve Exchange (EPRX). Our own aggregation.

Product	Volume won by batteries (yen/kW per 30 min)	Product as a whole (yen/kW per 30 min)
Primary reserve (online)	9.83	4.84
Secondary reserve 1	11.23	2.95
Secondary reserve 2	12.49	2.54
Tertiary reserve 1	12.49	2.47
Tertiary reserve 2	48.22	4.18
Composite product	9.78	3.07

Both are averages weighted by awarded volume (May 2026, preliminary figures, nationwide). For Tertiary reserve 2, batteries won only 0.5% of the awarded volume, and much of it was in high-priced 30-minute slots, so their average comes out high. Primary reserve (offline) is not shown in this table or the figure, because we do not include its published figures by resource type in our aggregation.

13. ② Balancing market (EPRX) | Revenue is concentrated in a small number of slots

We ranked the month's 30-minute slots with awards by revenue (average awarded price × awarded volume, nationwide), from highest to lowest, and plotted for each product what % of the month's revenue the top slots account for. The more a curve bulges above the dotted line, the more revenue is concentrated in a few slots. Tertiary reserve 2 is a product that covers errors in forecasting renewable output caused by the weather. Its price is low in most slots and high in only a few.

In the balancing market, the share of revenue in the top 10% of slots was 54.2% for Tertiary reserve 2 and 14.7% for Primary reserve (online). For the top 1%, it was 7.1% and 1.9%.

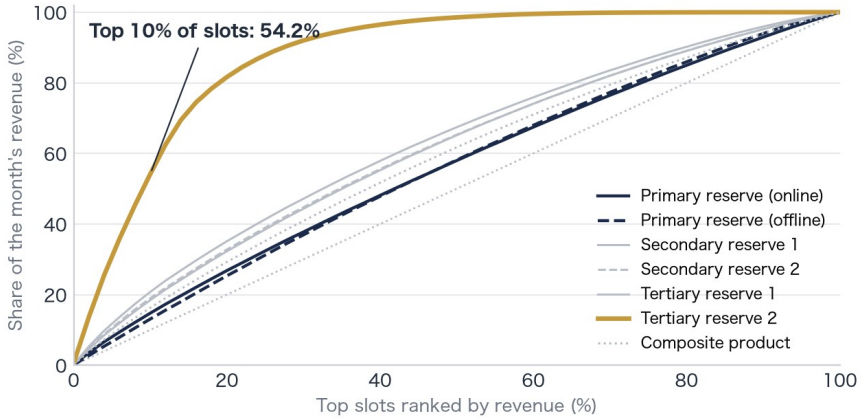

Figure 12 Share of balancing market revenue concentrated in the top 30-minute slots (May 2026 (1st to 31st), nationwide)

Source: Trading results (preliminary figures) published by the Electric Power Reserve Exchange (EPRX). Our own aggregation.

In May 2026, out of 1,249 30-minute slots with awards, the top 1% by revenue (average awarded price × awarded volume) accounted for 7.1% of the month's revenue. There were 146 slots with a nationwide average awarded price of 10 yen/kW per 30 min or more, and 239 slots with no awards.

30-minute slots with the highest maximum awarded price (by the area where the resource is located):

Date	Time	Area	Maximum awarded price (yen/kW per 30 min)
May 12	14:00	Kansai	138.23
May 12	14:30	Kansai	138.23
May 1	9:00	Tokyo	97.00
May 1	9:30	Tokyo	97.00
May 1	10:00	Tokyo	97.00

Source: Tertiary reserve 2 trading results (preliminary figures) published by the Electric Power Reserve Exchange (EPRX). Our own aggregation.

14. ③ Capacity market (OCCTO) | A market that buys future supply capacity

The capacity market buys electricity supply capacity 4 years ahead through an annual auction. The price is set in yen per kW per year. The left figure shows the clearing prices of past main auctions. The right figure shows the battery and pumped hydro capacity contracted in the Long-Term Decarbonization Power Source Auction (a separate auction that supports new builds such as batteries and pumped hydro). These are published once a year, so they do not change every month. The latest is delivery FY2029 (published January 2026).

In the capacity market, Tokyo's clearing price was 14,137 yen/kW for delivery FY2024, 3,495 yen/kW for FY2025, 5,834 yen/kW for FY2026 and 15,111 yen/kW for FY2029. In the capacity market's Long-Term Decarbonization Power Source Auction, contracted battery and pumped hydro capacity in the FY2025 auction was 819 MW for lithium-ion and 886 MW for non-lithium. This is the latest annual publication, so it does not change every month.

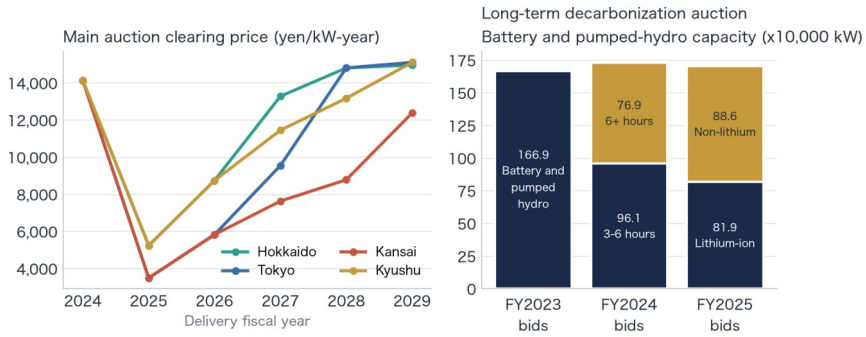

Figure 13 Capacity market clearing prices (left, yen/kW) and contracted battery and pumped hydro capacity in the Long-Term Decarbonization Power Source Auction (right, in units of 10,000 kW)

Source: Auction results and capacity contract documents published by the Organization for Cross-regional Coordination of Transmission Operators (OCCTO) (sources in the last section (Assumptions and terms)). As published.

15. Our records | Where battery storage projects are increasing

We counted the projects newly listed this month on our DealRoom (our data room for buyers, a site where we list battery storage projects), by grid area of the grid operator. These are figures for projects we handled, not the number for the whole market. Transfer of rights is a sale where the land and grid rights are handed over. Completed-build handover is a sale where the project is handed over once the equipment is built.

New listings on our DealRoom in May 2026 were 15 projects, 29.9 MW. By grid area: Chubu 5 projects, 10.0 MW; Tokyo 4 projects, 7.9 MW; Tohoku 3 projects, 6.0 MW; Shikoku, Kansai and Kyushu 1 project, 2.0 MW each.

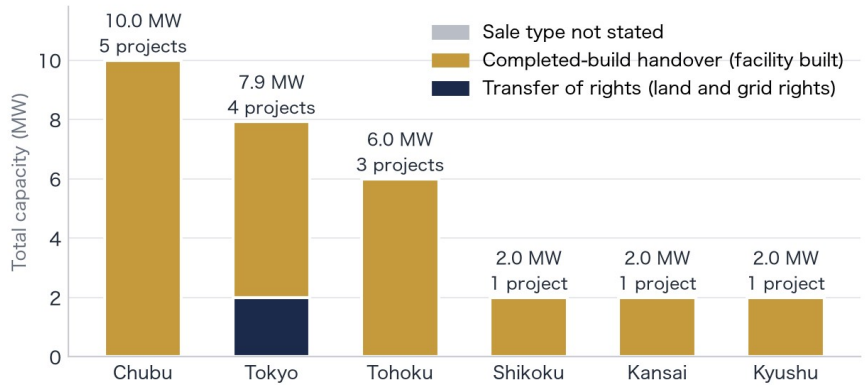

Figure 14 Output of projects listed on our DealRoom in May 2026 (MW)

Source: Our DealRoom records (project locations are given only to the grid area; prices and parties are not listed).

16. Our records | How many months and how much it costs to connect to the grid

A grid connection study is the procedure where the grid operator checks "whether you can connect at this location, and how much the work will cost". The grid connection cost contribution is the part of the connection work paid by the applicant. Of the reply documents we received, we aggregated only the high-voltage ones (connecting to 6,600V distribution lines) by grid area. Extra-high voltage is not included. Grid areas with fewer than 5 cases are not shown.

Medians of the grid connection study replies (high voltage only, as of October 19, 2026) ranged from 8.0 months in Tokyo to 17.0 months in Tohoku for the construction period, and from ¥3.02 million in Tokyo to ¥32.35 million in Tohoku for the grid connection cost contribution.

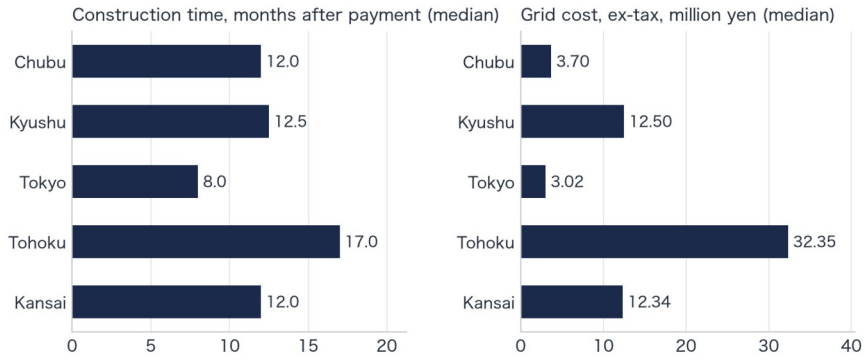

Figure 15 Median grid connection study replies (high voltage) by grid area (left: months of construction, right: grid connection cost contribution, excluding tax)

Source: Aggregation of high-voltage grid connection study replies from general transmission and distribution operators received by us (as of October 19, 2026).

17. Market figures (tables ready to use in your documents)

We put the figures behind the figures in the text into tables you can use in your own documents: ① wholesale electricity (JEPX) figures by area and trading volume, ② nationwide balancing market figures by product (bid ratio, award rate, price, battery share), and ③ capacity market clearing prices.

Wholesale electricity, JEPX spot market (May 2026, by area, yen/kWh)

Area	Monthly average	Same month last year	Daytime (8:00–16:00)	Evening (16:00–20:00)	4-hour spread	Maximum	30-minute slots at 30 yen or more	30-minute slots at 0.01 yen
System (nationwide)	14.06	8.92	8.45	19.72	16.40	40.41	44	150
Hokkaido	13.65	8.50	6.09	20.56	19.77	40.00	35	210
Tohoku	14.38	9.80	6.86	22.25	21.14	50.00	61	219
Tokyo	18.01	11.19	15.57	23.33	18.00	50.01	120	70
Chubu	16.23	8.49	12.34	20.96	15.88	40.41	76	104
Hokuriku	13.94	7.86	11.36	18.28	13.72	40.41	53	114
Kansai	13.94	7.86	11.36	18.28	13.73	40.41	53	118
Chugoku	11.76	7.84	5.82	16.64	15.45	40.41	18	213
Shikoku	7.57	7.56	4.04	9.07	12.97	31.96	5	352
Kyushu	9.48	7.34	2.31	14.43	16.64	40.41	12	425

Trading volume (May 2026, total for 31 days): total contracted volume 27,779 million kWh (same month last year 20,872 million kWh), sell bids 44,742 million kWh, buy bids 34,116 million kWh.

Source: Spot market trading results published by the Japan Electric Power Exchange (JEPX). Prices are simple averages of 30-minute slots. Our own aggregation.

Balancing market (May 2026, preliminary figures, nationwide)

Product	Requested (MW)	Offered (MW)	Awarded (MW)	Bid ratio (offered ÷ requested)	Award rate (awarded ÷ offered)	Average awarded price (yen/kW per 30 min)	Battery share
Primary reserve (online)	1,581.1	1,122.1	1,033.0	71.0%	92.1%	4.84	28.2%
Primary reserve	498.2	201.1	172.1	40.4%	85.6%	12.53	—

© Science X Inc. · https://www.scix.co.jp

Product	Requested (MW)	Offered (MW)	Awarded (MW)	Bid ratio (offered ÷ requested)	Award rate (awarded ÷ offered)	Average awarded price (yen/kW per 30 min)	Battery share
(offline)							
Secondary reserve 1	1,330.5	1,660.9	1,085.9	124.8%	65.4%	2.95	2.3%
Secondary reserve 2	1,318.8	2,706.9	2,088.7	205.2%	77.2%	2.54	0.9%
Tertiary reserve 1	3,153.7	4,205.0	2,975.6	133.3%	70.8%	2.47	0.7%
Tertiary reserve 2	551.1	1,326.4	494.3	240.7%	37.3%	4.18	0.5%
Composite product	3,961.2	4,579.5	3,348.2	115.6%	73.1%	3.07	8.9%

Volumes are averages per 30-minute slot. Where the bid ratio is below 100%, offers fall short of the volume requested. The award rate is the share of the offered volume that was awarded. The battery share for Primary reserve (offline) is "—" because we do not include its published figures by resource type in our aggregation.

Source: Trading results (preliminary figures) and trading results by resource type published by the Electric Power Reserve Exchange (EPRX). Our own aggregation.

18. Assumptions and terms

- The figures are our own aggregation of the published figures in the sources. We have not added up several months or converted figures to annual values. We do not show revenue amounts for any single battery storage plant.
- Months covered: wholesale electricity (JEPX) is May 2026 (31 days), and the balancing market (EPRX) is May 2026 preliminary figures (delivery dates up to the 31st). For the balancing market, the month differs until the published figures for May 2026 are included in our aggregation.
- Average prices are simple averages of 30-minute slots (not weighted by trading volume). Daytime is the slots from 8:00 to 16:00, and evening is the slots from 16:00 to 20:00.
- Spread: the day's 30-minute slots are ranked by price, and the average of the 8 lowest slots is subtracted from the average of the 8 highest slots (4 hours) (4 slots for 2 hours). This ignores the order of the cheap and expensive hours, electricity lost in charging and discharging, and fees, taxes and grid usage charges. It does not represent actual revenue.
- Balancing market: nationwide figures (total column) from EPRX preliminary figures. Requested volume is by grid operator (TSO); offered volume, awarded volume and average awarded price are by the area where the resource is located. Volumes are averages per 30-minute slot. The average awarded price is weighted by awarded volume. Bid ratio = volume offered ÷ volume requested; award rate = volume awarded ÷ volume offered. For 3-hour blocks up to March 13, 2026, we counted each block as 6 30-minute slots.
- Range of awarded prices: the thin line runs, across the month's 30-minute slots with awards, from the lowest bid (minimum awarded price) to the highest bid (maximum awarded price) (published figures by the area where the resource is located). The published figures for Primary reserve (online), Secondary reserve 1 and 2 and Tertiary reserve 1 also include Composite product bids (a single price for several products combined). So we removed from the thin line bids above the price cap of 15 yen for Primary reserve (online) and Secondary reserve 1 (for delivery up to August 31, 2026), and above 10 yen for Secondary reserve 2 and Tertiary reserve 1, where a Composite product bid in the same 30-minute slot and area can explain them. For Primary reserve (offline), we removed from the thin line bids above the price cap (15 yen this month) (the balancing market system also awards bids above the cap, and cuts them down to the cap at settlement). The thick band is the range from the 10% to the 90% point when the average awarded prices of the slots with awards are ranked from lowest to highest. The dot is the average weighted by awarded volume.
- Award rate by grid area × time of day: total awarded volume ÷ total offered volume for the slots at the same time of day across the month (by the area where the resource is located).
- The time from instruction to output change and the duration for balancing market products are the FY2026 specifications. For Primary reserve, the online category connects to the grid operator by a dedicated line, and the offline category runs on the simplified dispatch system without a dedicated line.
- High-priced slots for Tertiary reserve 2: slots with a nationwide average awarded price of 10 yen/kW per 30 min or more. The top 1% is the top 1% of slots ranked by revenue (average awarded price × awarded volume). The maximum awarded price is the published figure by the area where the resource is located.

- Capacity market auction results for each delivery fiscal year were published in different years (FY2024 in 2020, FY2029 in January 2026). We do not show the number of battery projects in the Long-Term Decarbonization Power Source Auction, because it is not in the published summary tables.

Sources: Japan Electric Power Exchange JEPX spot market trading results / Electric Power Reserve Exchange EPRX trading results (preliminary figures) and trading results by resource type / Organization for Cross-regional Coordination of Transmission Operators (OCCTO) capacity market main auction results and Long-Term Decarbonization Power Source Auction capacity contract documents / our aggregation of grid connection study replies we received / our DealRoom records.

Terms: system price (System, nationwide) = the wholesale electricity price when all of Japan is treated as a single market. Area price = the price that splits by area depending on congestion on the power lines. The grid = the power companies' transmission network.

© Science X Inc. · https://www.scix.co.jp

Grid connection = connecting to the transmission network. MW = the size of power output (1MW = 1,000kW). MWh = the amount of electricity that can be stored. Yen/kWh = the price per 1kWh of electricity.
