ScienceX

Battery Storage Market Notes, June 2026 issue

Science X Inc. Published November 5, 2026

The price of electricity changes with the time of day. A "grid-scale battery" (a large battery connected to the power grid that stores electricity and releases it) earns money from that difference. These notes use published figures and our own records to show this month's trends in figures and tables. This issue is a back issue, made retroactively in November 2026. The grid connection study figures are as of when it was made (October 19, 2026).

1. Three revenue streams for a battery storage site (how to read these notes)

A battery storage site (grid-scale battery) earns revenue from three markets. ① Wholesale electricity (JEPX) is the market where you buy electricity to store when it is cheap and sell it when it is expensive. ② The balancing market (EPRX) is the market where you sell grid operators the "capacity" to correct surpluses or shortages of electricity. ③ The capacity market (OCCTO) is the market where the government buys future electricity supply capacity in advance. These notes present the figures for these three markets in this order. The ①②③ at the start of each section title shows which market it is about.

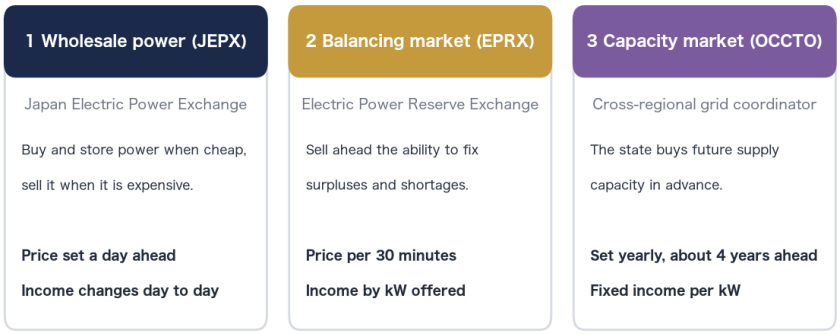

Figure 1 Three revenue streams for a battery storage site

Source: the market rules of Japan Electric Power Exchange (JEPX), Electric Power Reserve Exchange (EPRX) and Organization for Cross-regional Coordination of Transmission Operators (OCCTO).

2. Three trends this month

From the figures of the three markets, we picked three trends this month.

- In wholesale electricity (JEPX), the monthly average of the spread between the average of the 4 highest-priced hours and the 4 lowest-priced hours was 12.89 yen/kWh in Tokyo and 8.89 yen/kWh in Kyushu.
- In the balancing market (EPRX), the bid-to-request ratio for Primary reserve (online) went above 100% for the first time since April 2025, reaching 106.8% this month (June 2026). The average winning price was 4.00 yen/kW per 30 min.
- In the balancing market (EPRX), for Tertiary reserve 2, the top 10% of 30-minute slots by revenue (average winning price × awarded volume) accounted for 47.9% of the month's revenue.

3. ① Wholesale electricity (JEPX) | Average prices

Wholesale electricity is electricity that power companies and retailers buy and sell. Its price is set on the "spot market" of Japan Electric Power Exchange (JEPX) (a market where electricity for the next day is traded the day before). "System (nationwide)" is the price when all of Japan is treated as one market (the system price). When transmission lines between regions are congested, prices split by area from Hokkaido to Kyushu (area prices).

The monthly average for wholesale electricity, System (nationwide), was 15.10 yen/kWh, compared with 10.87 yen/kWh in the same month last year (a difference of 4.23 yen).

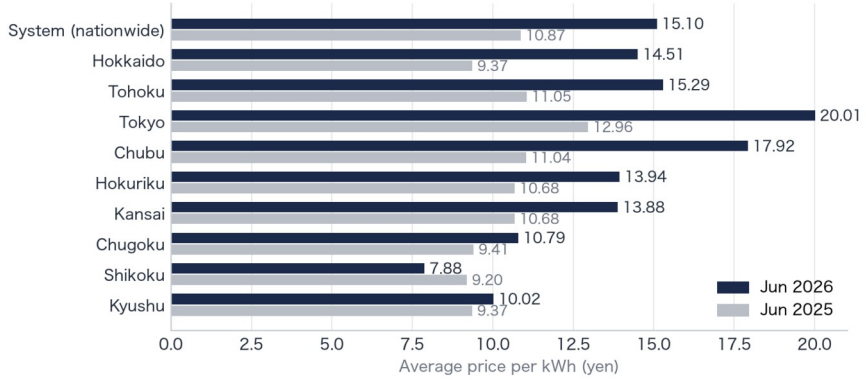

Figure 2 Average wholesale electricity price (yen/kWh). Navy is June 2026, grey is the same month last year

Source: spot market trading results published by Japan Electric Power Exchange (JEPX). Simple average of 30-minute prices. Our tally.

4. ① Wholesale electricity (JEPX) | How the price moves during the day

The wholesale electricity price changes every 30 minutes. The figure shows the daily shape, averaging the price at each time of day over the month. If a battery stores electricity at cheap times and releases it at expensive times, the difference becomes its revenue.

Within the day, the average wholesale price in Tokyo was lowest at 16.25 yen around 5:30 and highest at 27.93 yen around 18:30. In Kyushu, it was 5.75 yen around 12:30 and 15.05 yen around 18:30 (yen/kWh).

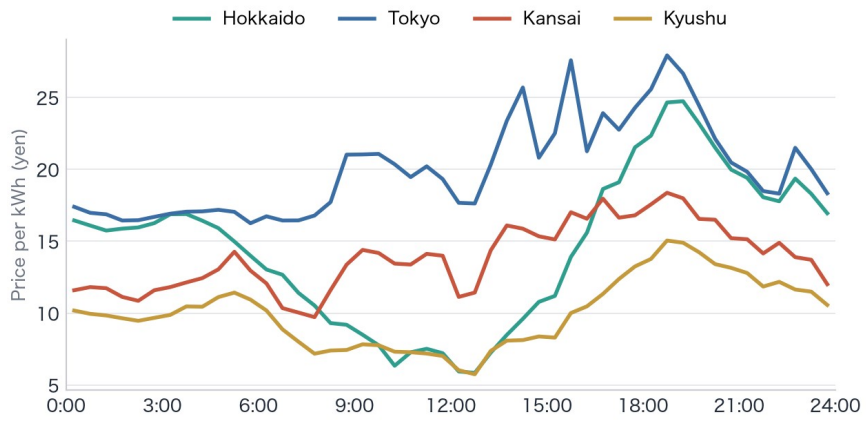

Figure 3 Daily peaks and troughs of the wholesale electricity price (June 2026 average, yen/kWh)

Source: JEPX spot market. Our tally.

5. ① Wholesale electricity (JEPX) | How large is the spread per kWh

We took the average price of the day's 4 highest-priced hours, subtracted the average price of the 4 lowest-priced hours, and show the monthly average by area. This is the difference per kWh if you buy 1 kWh in the 4 cheapest hours and sell it in the 4 most expensive hours. It is a simple difference: it does not subtract electricity lost in charging and discharging or fees, and it ignores whether the cheap hours come before the expensive ones.

The monthly average of the wholesale spread between the 4 highest and 4 lowest hours was largest in Tohoku at 18.63 yen/kWh and smallest in Kyushu at 8.89 yen/kWh.

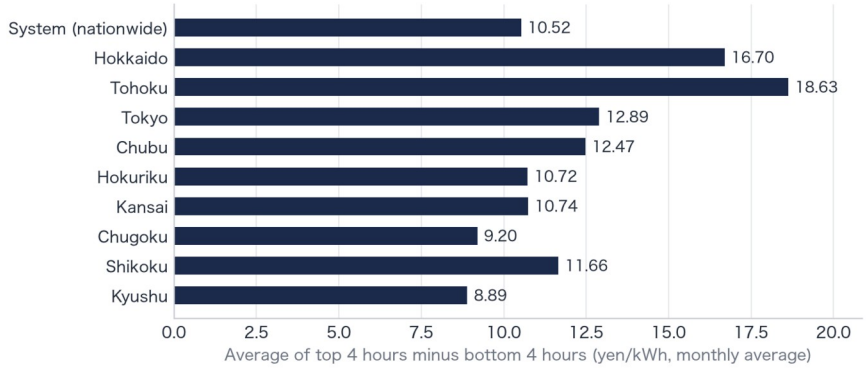

Figure 4 Wholesale electricity spread: average of 4 highest hours − average of 4 lowest hours (June 2026, yen/kWh, monthly average)

Source: JEPX spot market. Our tally.

Area	2-hour spread (yen/kWh)	4-hour spread (yen/kWh)	Days with a 4-hour spread of 10 yen or more
System (nationwide)	12.11	10.52	15
Hokkaido	18.90	16.70	25
Tohoku	20.71	18.63	25
Tokyo	15.65	12.89	23
Chubu	14.29	12.47	20
Hokuriku	12.81	10.72	14
Kansai	12.93	10.74	14
Chugoku	10.30	9.20	11
Shikoku	13.59	11.66	21
Kyushu	9.95	8.89	12

The spread is the monthly average of the daily spreads. June 2026 covers 30 days.

6. ① Wholesale electricity (JEPX) | There is a spread every day

We show the same 4-hour spread day by day. The larger the spread on a day, the more room a battery has to earn from it.

Of the 30 days, the wholesale 4-hour spread was 10 yen or more on 15 days for System (nationwide), 25 days in Hokkaido and Tohoku, 23 days in Tokyo and 12 days in Kyushu.

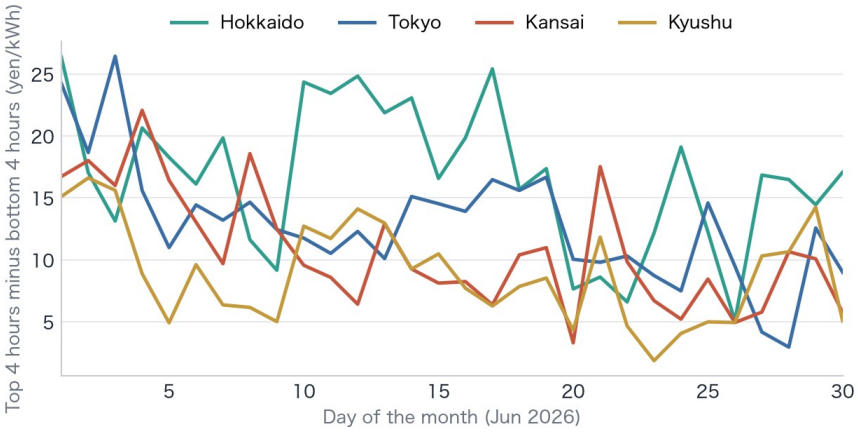

Figure 5 Daily wholesale electricity spread (average of the day's 4 highest hours − average of the 4 lowest hours, yen/kWh)

Source: JEPX spot market. Our tally.

7. ② Balancing market (EPRX) | 7 products and prices by area

The balancing market is where grid operators buy, every 30 minutes, the "capacity" to correct surpluses or shortages of electricity. Products are divided by how fast output changes after an instruction. Primary reserve is the fastest and Tertiary reserve 2 is the slowest. Primary reserve has two categories: "online", connected to the grid operator by a dedicated line, and "offline", which runs on the simplified dispatch system without a dedicated line. They are tendered and traded separately, so we show them separately. A Composite product is a bid that offers several products together. The price is set in yen per 1 kW of available capacity per 30 minutes. The figure shows the range of winning prices by area (by area where the power source is located). The thin line runs from the cheapest to the most expensive winning bid in the month, the thick band is the price range covering 8 of every 10 30-minute slots with awards, and the dot is the average winning price. Nationwide figures are in the table in the "Market figures" section.

By area, the highest average winning price in the balancing market was Primary reserve (offline) in Tohoku at 14.66 yen/kW per 30 min, and the lowest was Tertiary reserve 2 in Shikoku at 0.30 yen/kW per 30 min.

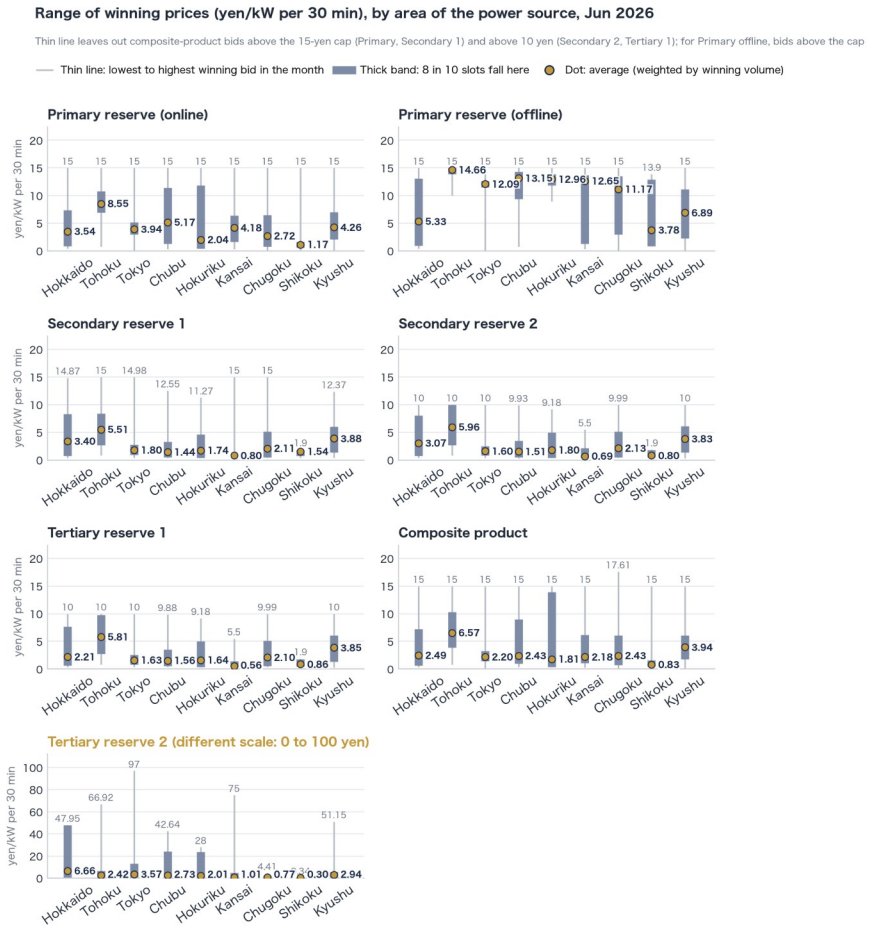

Figure 6 Range and average of winning prices by area in the balancing market (June 2026 (1st–30th), by area where the power source is located)

Source: trading results (preliminary) published by Electric Power Reserve Exchange (EPRX). Our tally.

Product	Time from instruction to output change	Duration
Primary reserve (online)	Within 10 seconds	5 minutes or more
Primary reserve (offline)	Within 10 seconds	5 minutes or more
Secondary reserve 1	Within 5 minutes	30 minutes
Secondary reserve 2	Within 5 minutes	30 minutes
Tertiary reserve 1	Within 15 minutes	30 minutes
Tertiary reserve 2	Within 60 minutes	30 minutes
Composite product	Requirements of the combined products	Requirements of the combined products

8. ② Balancing market (EPRX) | Grid areas and times where bids win most easily

The award rate is the share of the bid volume that was awarded. The higher it is, the more easily bids win. The figure plots the award rate for each product by time of day (every 30 minutes), for each grid area (area where the power source is located). Where a line breaks, there were no bids at that time.

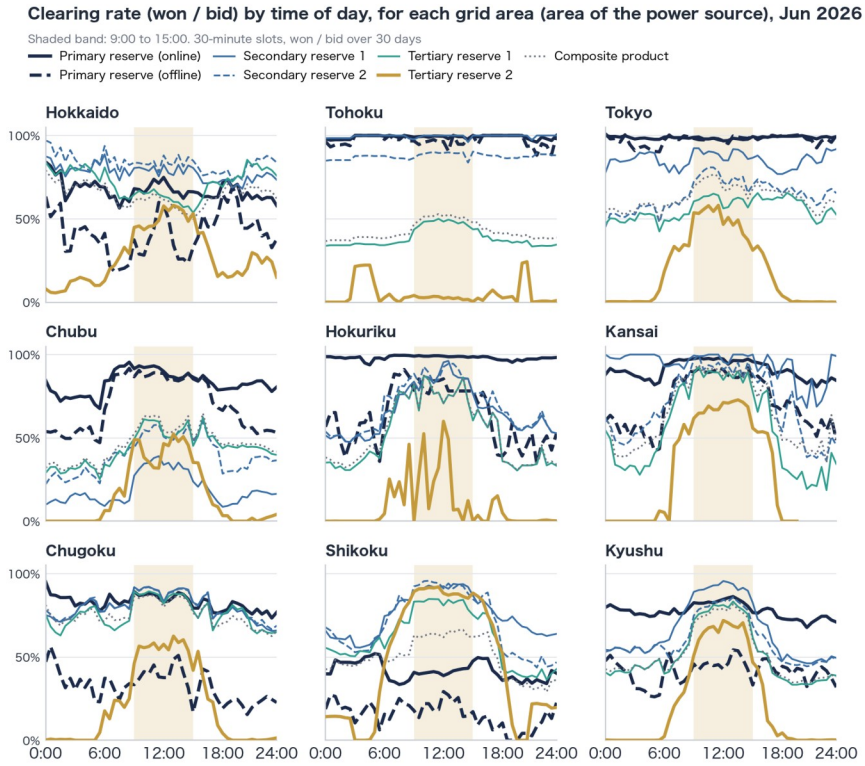

Figure 7 Award rate in the balancing market (grid area (area where the power source is located) × time of day, June 2026 (1st–30th))

Source: trading results (preliminary) published by Electric Power Reserve Exchange (EPRX). Our tally.

9. ② Balancing market (EPRX) | Primary reserve (online) became a competition for places

Primary reserve is the fastest product, changing output within 10 seconds of an instruction, and batteries are often used for it. The left side is the online category and the right side the offline category. The bars are the bid-to-request ratio (bid volume ÷ volume requested by grid operators). Above 100%, more bids came in than were requested, and some bids lose. The line is the average winning price. These are monthly figures from April 2025, the data we have. Primary reserve (offline) figures start in April 2026.

In the balancing market, the bid-to-request ratio for Primary reserve (online) went above 100% for the first time this month (June 2026), at 106.8%, and the average winning price rose from 3.90 yen a year earlier to 4.00 yen (yen/kW per 30 min). For Primary reserve (offline) this month, the bid-to-request ratio was 51.5% and the average winning price was 11.71 yen/kW per 30 min.

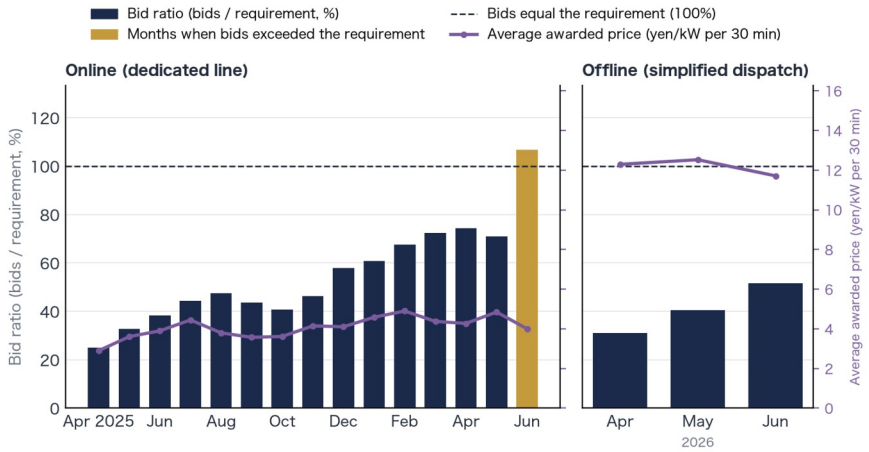

Figure 8 Bid-to-request ratio (bars) and average winning price (line) for Primary reserve (monthly; left is online, right is offline; gold bars are months when bids exceeded the requested volume)

Source: trading results (preliminary) published by Electric Power Reserve Exchange (EPRX). Our tally.

10. ② Balancing market (EPRX) | How prices by product have moved

These are average winning prices by product since April 2025 (monthly averages weighted by awarded volume). Primary reserve (offline) figures start in April 2026. From March 14, 2026, Primary through Tertiary reserve 1 and the Composite product moved from trading in 3-hour blocks to trading in 30-minute slots (Tertiary reserve 2 was already 30 minutes).

In the balancing market, the average winning price of Tertiary reserve 2 was 1.12 yen in April 2025 and 2.45 yen this month, with a high of 4.18 yen in May 2026 (yen/kW per 30 min). Primary reserve (online) was 2.89 yen in April 2025 and 4.00 yen this month, with a high of 4.90 yen in February 2026.

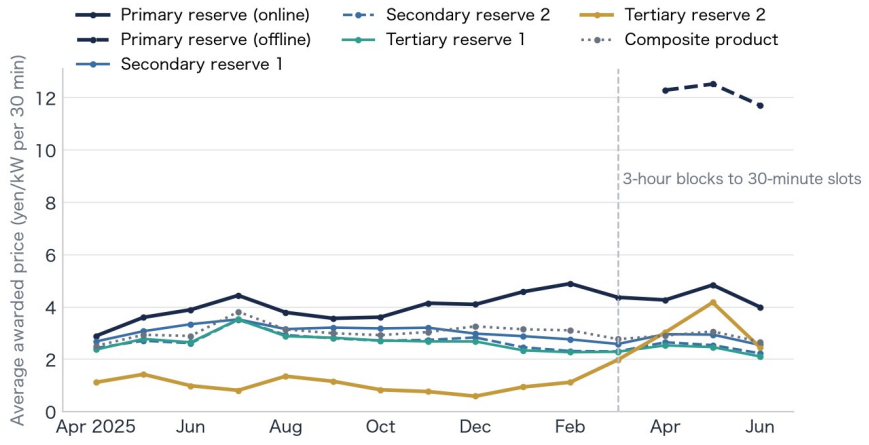

Figure 9 Average winning price by product in the balancing market (yen/kW per 30 min, monthly)

Source: trading results (preliminary) published by Electric Power Reserve Exchange (EPRX). Our tally.

11. ② Balancing market (EPRX) | Which hours of the day are expensive

These are hourly average winning prices by product for June 2026 (1st–30th).

In the balancing market, the average winning price of Tertiary reserve 2 was highest at 30.42 yen around 20:00 and lowest at 0.50 yen around 1:00 (yen/kW per 30 min). Primary reserve (online) was highest at 4.62 yen around 18:00 and lowest at 3.20 yen around 2:00.

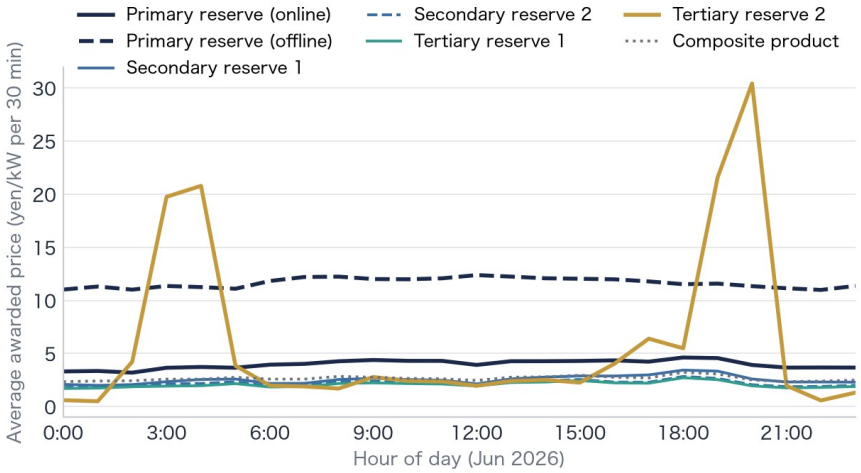

Figure 10 Average winning price by time of day in the balancing market (June 2026 (1st–30th), yen/kW per 30 min)
Source: trading results (preliminary) published by Electric Power Reserve Exchange (EPRX). Our tally.

12. ② Balancing market (EPRX) | Which products batteries are used for

The figure shows the share of awarded volume held by batteries. The table compares the average winning price of the volume won by batteries with the average winning price for the whole product.

In the balancing market, the battery share was 23.5% for Primary reserve (online) and 0.3% for Tertiary reserve 2. The average winning price of the volume won by batteries was 9.52 yen for Primary reserve (online) (overall 4.00 yen) and 41.95 yen for Tertiary reserve 2 (overall 2.45 yen) (yen/kW per 30 min).

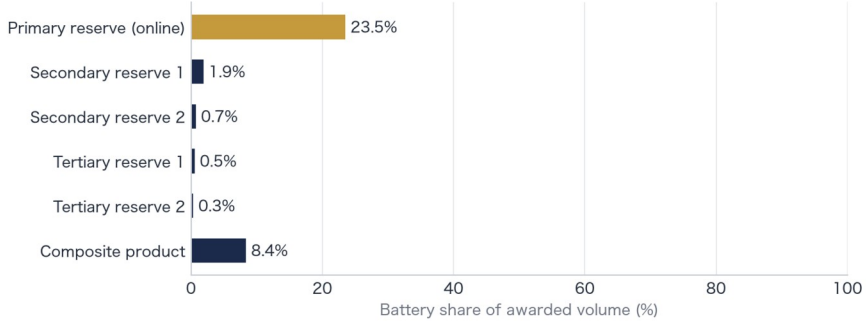

Figure 11 Share held by batteries in the balancing market (%)
Source: trading results (preliminary) by power source type, published by Electric Power Reserve Exchange (EPRX). Our tally.

Product	Awarded to batteries (yen/kW per 30 min)	Whole product (yen/kW per 30 min)
Primary reserve (online)	9.52	4.00
Secondary reserve 1	10.67	2.55
Secondary reserve 2	11.41	2.23
Tertiary reserve 1	11.08	2.11
Tertiary reserve 2	41.95	2.45
Composite product	9.51	2.67

Both are averages weighted by awarded volume (June 2026, preliminary, nationwide). Batteries hold only 0.3% of the awarded volume of Tertiary reserve 2, and much of it was won in high-price slots, so their average comes out high. Primary reserve (offline) is not in this table or the figure, because we have not included its published values by power source type in our tally.

13. ② Balancing market (EPRX) | Revenue is concentrated in a small number of slots

We sorted the month's 30-minute slots with awards by revenue (average winning price × awarded volume, nationwide), from highest to lowest, and plotted for each product what share of the month's revenue the top slots account for. The more the curve bulges above the dotted line, the more revenue is concentrated in a few slots. Tertiary reserve 2 is the product that covers errors in forecasting renewable output caused by the weather. Its price is low in most slots and high in only a few.

In the balancing market, the top 10% of slots by revenue accounted for 47.9% of the month's revenue for Tertiary reserve 2 and 14.4% for Primary reserve (online). For the top 1% of slots, the shares were 7.3% for Tertiary reserve 2 and 1.7% for Primary reserve (online).

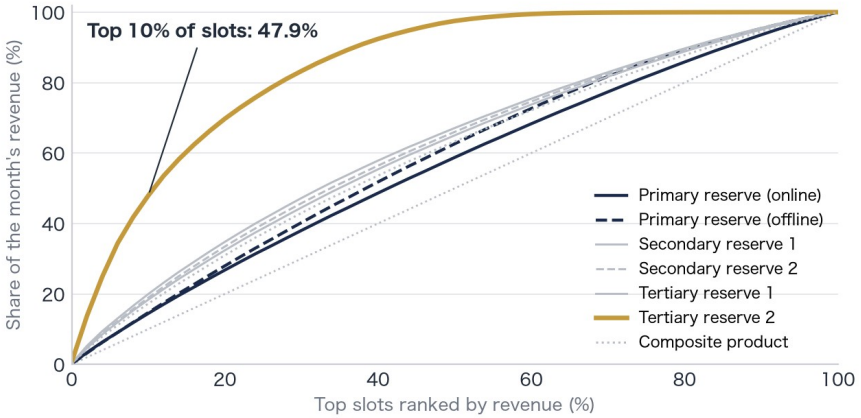

Figure 12 Share of revenue concentrated in the top 30-minute slots in the balancing market (June 2026 (1st–30th), nationwide)

Source: trading results (preliminary) published by Electric Power Reserve Exchange (EPRX). Our tally.

In June 2026, of the 1,199 30-minute slots with awards, the top 1% by revenue (average winning price × awarded volume) accounted for 6.7% of the month's revenue. There were 59 slots with a nationwide average winning price of 10 yen/kW per 30 min or more, and 241 slots with no awards.

30-minute slots with the highest top winning prices (by area where the power source is located):

Day	Time	Area	Highest winning price (yen/kW per 30 min)
June 1	9:30	Tokyo	97.00
June 1	10:00	Tokyo	97.00
June 2	9:00	Tokyo	97.00
June 2	11:30	Tokyo	97.00
June 4	9:00	Tokyo	97.00

Source: Tertiary reserve 2 trading results (preliminary) published by Electric Power Reserve Exchange (EPRX). Our tally.

14. ③ Capacity market (OCCTO) | A market that buys future supply capacity

The capacity market buys electricity supply capacity 4 years ahead in a once-a-year auction. The price is set in yen per kW per year. The left figure shows the clearing prices of past main auctions. The right figure shows the battery and pumped hydro capacity awarded in the Long-Term Decarbonization Power Source Auction (a separate auction that supports new builds such as batteries and pumped hydro). These are published once a year, so they do not change every month. The latest is for delivery fiscal year FY2029 (published January 2026).

In the capacity market main auction, the clearing price for Tokyo was 14,137 yen/kW for FY2024, 3,495 yen/kW for FY2025 and 15,111 yen/kW for FY2029. In the Long-Term Decarbonization Power Source Auction, the awarded battery and pumped hydro capacity in the FY2025 auction was 819 MW for lithium-ion and 886 MW for non-lithium. Both are once-a-year values, the latest published, and do not change every month.

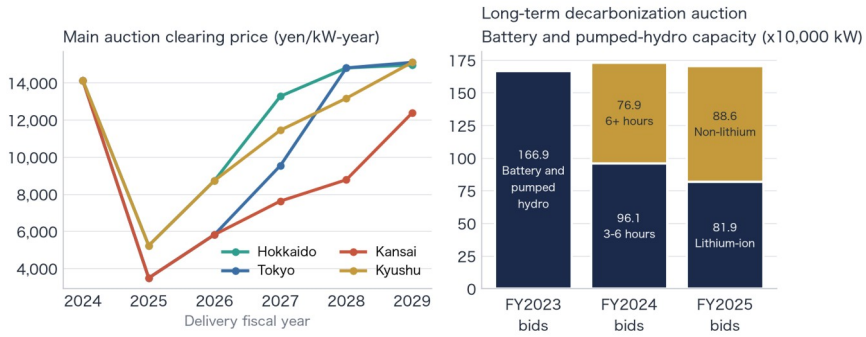

Figure 13 Capacity market clearing prices (left, yen/kW) and battery and pumped hydro capacity awarded in the Long-Term Decarbonization Power Source Auction (right, in units of 10,000 kW)

Source: clearing results and capacity contract documents published by Organization for Cross-regional Coordination of Transmission Operators (OCCTO) (links in the last section (Assumptions and terms)). As published.

15. Our records | Where battery storage projects are increasing

We counted, by grid area, the projects we newly listed this month on DealRoom (our data room for buyers, a site where we list battery storage projects). These are figures for projects we handled, not counts for the whole market. Transfer of rights is a sale that hands over the land and grid rights. Completed-build handover is a sale that hands over the site once the equipment is built.

New listings on our DealRoom in June 2026 were 93 projects, 775.0 MW. By grid area, these included Kyushu with 18 projects, 303.0 MW, and Chubu with 39 projects, 288.0 MW.

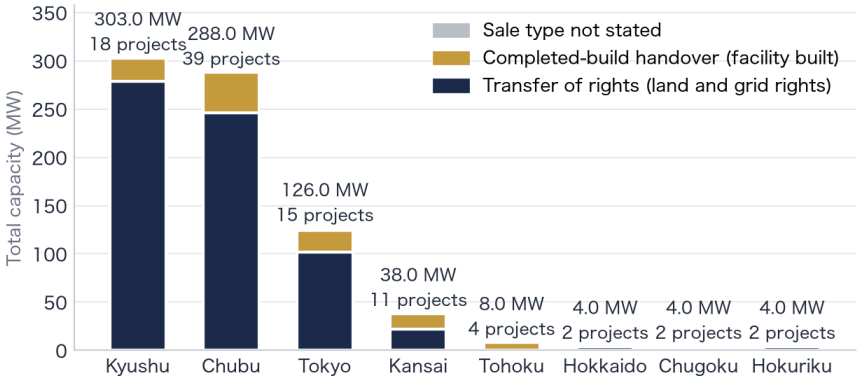

Figure 14 Output of projects we listed on DealRoom in June 2026 (MW)

Source: our DealRoom records (project locations are given only down to the grid area; prices and parties are not shown).

16. Our records | How many months and how much it costs to connect to the grid

A grid connection study is the process of asking a grid operator to check "can we connect at this location, and how much will the work cost?" The grid connection cost contribution is the part of the connection work cost paid by the applicant. From the replies we received, we tallied only high-voltage cases (connections to 6,600 V distribution lines) by grid area. Extra-high voltage is not included. Grid areas with fewer than 5 replies are not shown.

The medians of grid connection study replies (high voltage only, as of October 19, 2026) range from 8.0 months in Tokyo to 17.0 months in Tohoku for construction time, and from ¥3.02 million in Tokyo to ¥32.35 million in Tohoku for the grid connection cost contribution.

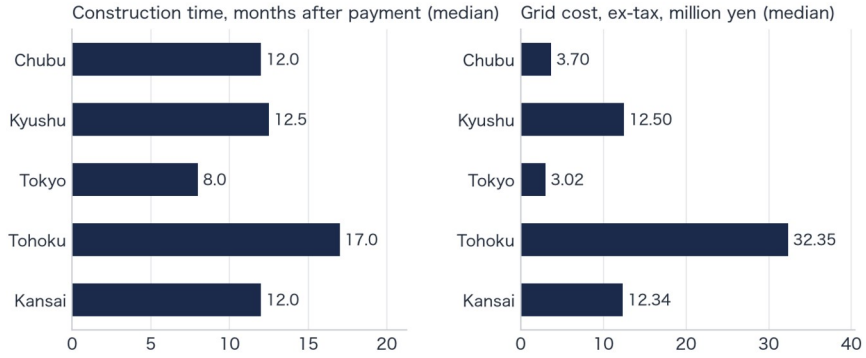

Figure 15 Medians of grid connection study replies (high voltage) by grid area (left: months of construction, right: grid connection cost contribution, excluding tax)

Source: our tally of the high-voltage share of grid connection study replies we received from general transmission and distribution operators (as of October 19, 2026).

17. Market figures (tables ready to use in documents)

We put the numbers behind the figures into tables you can use in your own documents: ① wholesale electricity (JEPX) figures by area and trading volume, ② nationwide balancing market figures by product (bid-to-request ratio, award rate, price, battery share), and ③ capacity market clearing prices.

Wholesale electricity, JEPX spot market (June 2026, by area, yen/kWh)

Area	Monthly average	Same month last year	Daytime (8:00–16:00)	Evening (16:00–20:00)	4-hour spread	Highest	Slots at 30 yen or more	Slots at 0.01 yen
System (nationwide)	15.10	10.87	13.06	19.46	10.52	32.17	25	2
Hokkaido	14.51	9.37	8.51	21.22	16.70	40.00	24	81
Tohoku	15.29	11.05	9.05	22.51	18.63	46.00	54	115
Tokyo	20.01	12.96	20.99	24.60	12.89	50.01	118	0
Chubu	17.92	11.04	16.55	22.82	12.47	40.24	82	4
Hokuriku	13.94	10.68	14.12	17.36	10.72	40.14	35	4
Kansai	13.88	10.68	14.06	17.31	10.74	40.14	34	7
Chugoku	10.79	9.41	8.45	13.49	9.20	28.00	0	69
Shikoku	7.88	9.20	6.12	9.31	11.66	20.95	0	189
Kyushu	10.02	9.37	7.58	13.17	8.89	28.00	0	128

Trading volume (June 2026, total for 30 days): total traded volume 28,588 million kWh (same month last year 22,294 million kWh), sell bids 47,236 million kWh, buy bids 35,469 million kWh.

Source: spot market trading results published by Japan Electric Power Exchange (JEPX). Prices are simple averages of 30-minute slots. Our tally.

Balancing market (June 2026, preliminary, nationwide)

Product	Requested volume (MW)	Bid volume (MW)	Awarded volume (MW)	Bid-to-request ratio (bids ÷ requested)	Award rate (awarded ÷ bids)	Average winning price (yen/kW per 30 min)	Battery share
Primary reserve (online)	1,388.0	1,481.9	1,202.1	106.8%	81.1%	4.00	23.5%
Primary reserve (offline)	497.1	256.1	175.7	51.5%	68.6%	11.71	—

Product	Requested volume (MW)	Bid volume (MW)	Awarded volume (MW)	Bid-to-request ratio (bids ÷ requested)	Award rate (awarded ÷ bids)	Average winning price (yen/kW per 30 min)	Battery share
Secondary reserve 1	886.5	2,016.3	1,104.8	227.4%	54.8%	2.55	1.9%
Secondary reserve 2	981.7	3,370.4	2,077.0	343.3%	61.6%	2.23	0.7%
Tertiary reserve 1	2,263.2	5,484.1	2,929.1	242.3%	53.4%	2.11	0.5%
Tertiary reserve 2	542.6	1,386.3	522.9	255.5%	37.7%	2.45	0.3%
Composite product	3,190.6	6,023.2	3,400.0	188.8%	56.4%	2.67	8.4%

Volumes are averages per 30-minute slot. Where the bid-to-request ratio is below 100%, bids fell short of the requested volume. The award rate is the share of the bid volume that was awarded. The battery share for Primary reserve (offline) is "—" because we have not included its published values by power source type in our tally.

Source: trading results (preliminary) and trading results by power source type, published by Electric Power Reserve Exchange (EPRX). Our tally.

Capacity market main auction area prices (yen/kW per year)

Delivery fiscal year	Hokkaido	Tohoku	Tokyo	Chubu	Hokuriku	Kansai	Chugoku	Shikoku	Kyushu
FY2024	14,137	14,137	14,137	14,137	14,137	14,137	14,137	14,137	14,137
FY2025	5,242	3,495	3,495	3,495	3,495	3,495	3,495	3,495	5,242
FY2026	8,749	5,833	5,834	5,832	5,832	5,832	5,832	5,832	8,748
FY2027	13,287	9,044	9,555	7,823	7,638	7,638	7,638	7,638	11,457

18. Assumptions and terms

- Figures are our tally of the values published by the sources. We have not summed several months or converted anything to annual figures. We do not show the revenue of any single battery storage site.
- Months covered: wholesale electricity (JEPX) is June 2026 (30 days), and the balancing market (EPRX) is June 2026 preliminary values (deliveries up to the 30th). For the balancing market, the month differs until the published June 2026 values are included in our tally.
- Average prices are simple averages of 30-minute slots (not weighted by trading volume). Daytime is the slots from 8:00 to 16:00, evening from 16:00 to 20:00.
- Spread: we sort the day's 30-minute slots by price and subtract the average of the 8 cheapest slots from the average of the 8 most expensive slots (4 hours) (for 2 hours, 4 slots). This ignores whether the cheap hours come before the expensive ones, electricity lost in charging and discharging, and fees, taxes and grid usage charges. It does not show actual revenue.
- Balancing market: EPRX preliminary values, nationwide (total column). Requested volume is by grid operator (TSO); bid volume, awarded volume and average winning price are by area where the power source is located. Volumes are averages per 30-minute slot. The average winning price is weighted by awarded volume. Bid-to-request ratio = bid volume ÷ requested volume; award rate = awarded volume ÷ bid volume. For the 3-hour blocks up to March 13, 2026, we counted 1 block as six 30-minute slots.
- Range of winning prices: the thin line runs, among the month's 30-minute slots with awards, from the cheapest bid (lowest winning price) to the most expensive bid (highest winning price) (published values by area where the power source is located). The published values for Primary reserve (online), Secondary reserve 1 and 2, and Tertiary reserve 1 also include Composite product bids (one price for several products bundled together). So we removed from the thin line bids above the price cap of 15 yen (for deliveries up to August 31, 2026) for Primary reserve (online) and Secondary reserve 1, and above 10 yen for Secondary reserve 2 and Tertiary reserve 1, where a Composite product bid in the same slot and area explains them. For Primary reserve (offline), we removed from the thin line bids above the price cap (15 yen this month) (the balancing market system also awards bids above the cap and lowers them to the cap at settlement). The thick band is the range from the bottom 10% to 90% when the average winning prices of slots with awards are sorted from low to high. The dot is the average weighted by awarded volume.
- Award rate by grid area × time of day: total awarded volume ÷ total bid volume for the slots at the same time of day in the month (by area where the power source is located).
- The time from instruction to output change and the duration for each balancing market product are the FY2026 specifications. For Primary reserve, online is the category connected to the grid operator by a dedicated line, and offline is the category that runs on the simplified dispatch system without a dedicated line.
- High-price slots for Tertiary reserve 2: slots with a nationwide average winning price of 10 yen/kW per 30 min or more. The top 1% is the top 1% of slots sorted by revenue (average winning price × awarded volume). The highest winning price is the published value by area where the power source is located.

- Capacity market clearing results are published in a different year for each delivery fiscal year (FY2024 in 2020, FY2029 in January 2026). We do not show the number of battery projects in the Long-Term Decarbonization Power Source Auction, because it is not in the published summary tables.

Sources: Japan Electric Power Exchange (JEPX) spot market trading results / Electric Power Reserve Exchange (EPRX) trading results (preliminary) and trading results by power source type / Organization for Cross-regional Coordination of Transmission Operators (OCCTO) capacity market main auction clearing results and Long-Term Decarbonization Power Source Auction capacity contract documents / our tally of grid connection study replies we received / our DealRoom records.

Terms: system price (System (nationwide)) = the wholesale electricity price when all of Japan is treated as one market. Area price = the price split by area depending on transmission line congestion. The grid = the power companies' transmission network. Grid

connection = connecting to the transmission network. MW = a measure of power (1 MW = 1,000 kW). MWh = the amount of electricity that can be stored. yen/kWh = the price per 1 kWh of electricity.
