ScienceX

Battery Storage Market Notes, July 2026 issue

Science X Inc. Published November 5, 2026

The price of electricity changes with the time of day it is used. A "grid-scale battery" (a large battery connected to the power grid that stores electricity and releases it) earns money from that difference. These notes use published figures and our own records to show this month's trends in figures and tables. This issue is a back issue, produced retroactively in November 2026. The grid connection study figures are as of the date it was produced (October 19, 2026).

1. The three income streams of a battery storage plant (how to read these notes)

A battery storage plant (grid-scale battery) earns its income from three markets. ① Wholesale electricity (JEPX) is the market where you buy electricity when it is cheap, store it, and sell it when it is expensive. ② The balancing market (EPRX) is the market where you sell grid operators the "capacity" to correct surpluses or shortages of electricity. ③ The capacity market (OCCTO) is the market where the country buys future electricity supply capacity in advance. These notes present the figures in the order of these three markets. The ①②③ at the start of each section title shows which market the section covers.

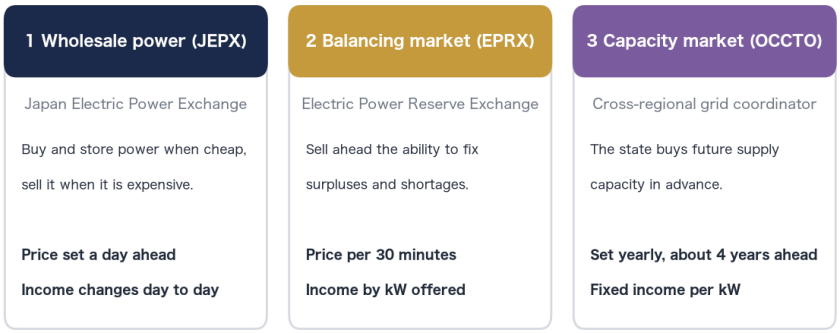

Figure 1 The three income streams of a battery storage plant

Source: Rules of the Japan Electric Power Exchange (JEPX), the Electric Power Reserve Exchange (EPRX) and the Organization for Cross-regional Coordination of Transmission Operators (OCCTO).

2. Three things that happened this month

We picked three trends from the figures of the three markets this month.

- In wholesale electricity (JEPX), the price gap between the average of the 4 most expensive hours and the 4 cheapest hours, averaged over July 2026, was 13.17 yen/kWh in Tokyo and 15.71 yen/kWh in Kyushu.
- In the balancing market (EPRX), the bid ratio for Primary reserve (online) first went above 100% since April 2025 in June 2026 (106.8%). This month it was 119.7%, and the average winning price was 4.35 yen/kW per 30 min.
- In the balancing market (EPRX), 57.3% of the month's sales of Tertiary reserve 2 (average winning price × winning volume) came from the top 10% of 30-minute slots.

3. ① Wholesale electricity (JEPX) | Average price

Wholesale electricity is electricity bought and sold among power companies and retailers. Its price is set on the "spot market" of the Japan Electric Power Exchange (JEPX), a market where electricity for the next day is traded the day before. "System (nationwide)" is the price when all of Japan is treated as one market (the system price). When the power lines between regions get congested, separate prices form for each area from Hokkaido to Kyushu (area prices).

The monthly average of wholesale electricity for System (nationwide) was 17.91 yen/kWh in July 2026, against 12.75 yen/kWh in the same month last year.

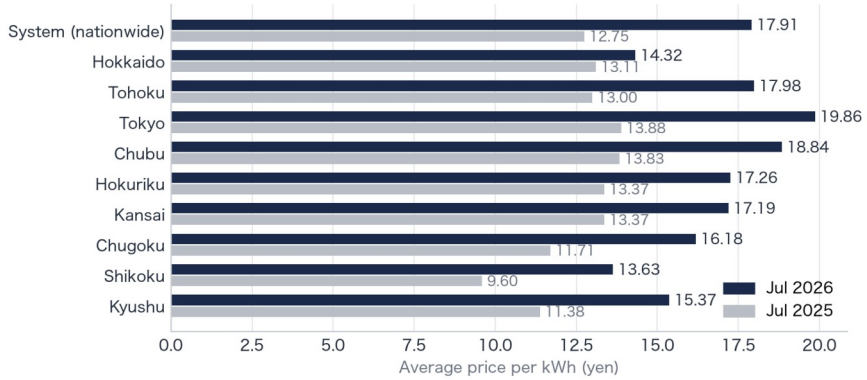

Figure 2 Average wholesale electricity price (yen/kWh). Navy is July 2026, grey is the same month last year

Source: Spot market trading results published by the Japan Electric Power Exchange (JEPX). Simple average of the 30-minute prices. Our tally.

4. ① Wholesale electricity (JEPX) | How the price moves through the day

The wholesale price changes every 30 minutes. The figure shows the shape of a typical day, with prices at the same time of day averaged over the month. If a battery charges when power is cheap and discharges when it is expensive, the difference becomes its income.

The daily low of wholesale electricity is 15.28 yen around 6:00 in Tokyo and 9.85 yen around 12:30 in Kyushu. The peak is around 18:30 in both areas: 28.07 yen in Tokyo and 27.02 yen in Kyushu (yen/kWh).

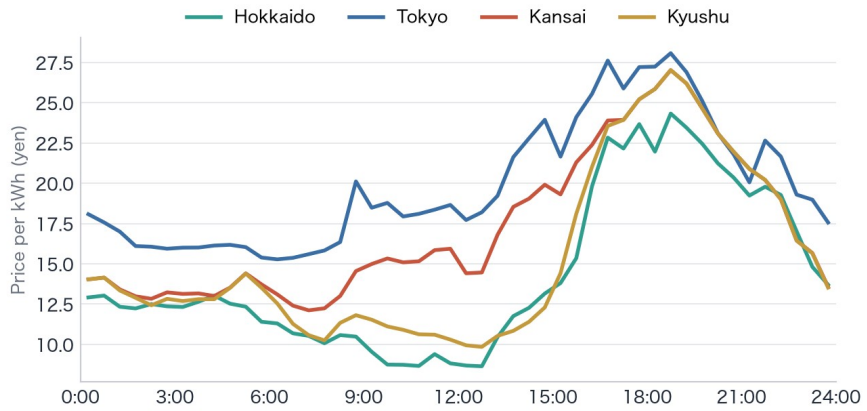

Figure 3 Daily peaks and lows of the wholesale electricity price (July 2026 average, yen/kWh)

Source: JEPX spot market. Our tally.

5. ① Wholesale electricity (JEPX) | How big is the price gap per kWh

For each area, we took the average price of the day's 4 most expensive hours minus the average price of its 4 cheapest hours, and show the monthly average. This equals the difference per kWh when you buy 1 kWh in the 4 cheapest hours and sell it in the 4 most expensive hours. It is a simple gap. It does not deduct electricity lost in charging and discharging or fees, and it ignores whether the cheap hours come before the expensive hours.

By area, the monthly average gap between the 4 most expensive and the 4 cheapest hours of wholesale electricity was largest in Shikoku at 16.78 yen/kWh and smallest in Tokyo at 13.17 yen/kWh.

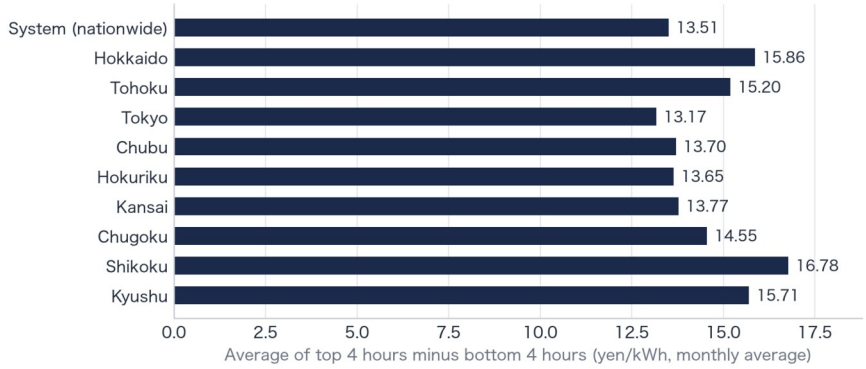

Figure 4 Wholesale electricity price gap: average of the 4 most expensive hours − average of the 4 cheapest hours (July 2026, yen/kWh, monthly average)

Source: JEPX spot market. Our tally.

Area	2-hour gap (yen/kWh)	4-hour gap (yen/kWh)	Days with a 4-hour gap of 10 yen or more
System (nationwide)	14.79	13.51	21
Hokkaido	17.92	15.86	25
Tohoku	17.24	15.20	26
Tokyo	15.15	13.17	22
Chubu	14.98	13.70	23
Hokuriku	14.98	13.65	21
Kansai	15.20	13.77	21
Chugoku	16.09	14.55	21
Shikoku	18.97	16.78	23
Kyushu	17.04	15.71	22

The gap is the monthly average of the daily gaps. July 2026 covers 31 days.

6. ① Wholesale electricity (JEPX) | The gap is there every day

We show the same 4-hour gap day by day. The bigger the gap on a given day, the more room a battery has to earn from it.

The 4-hour wholesale gap was 10 yen or more on 21 of 31 days for System (nationwide). By area, Tohoku had the most such days, with 26.

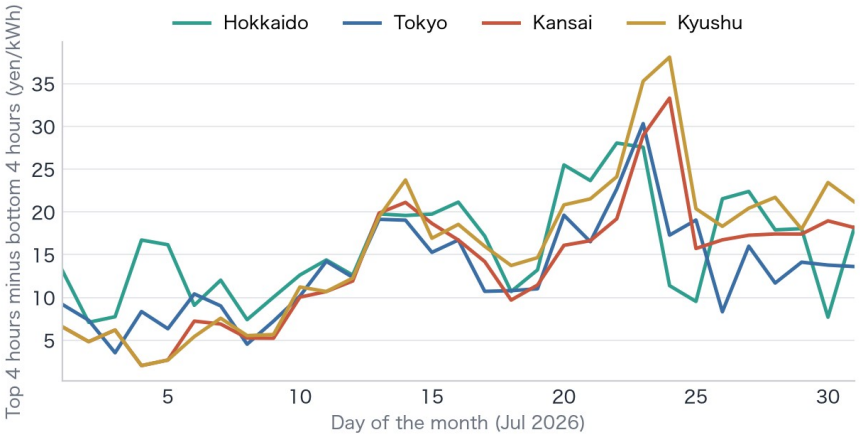

Figure 5 Daily wholesale electricity price gap (the day's average of the 4 most expensive hours − average of the 4 cheapest hours, yen/kWh)

Source: JEPX spot market. Our tally.

7. ② Balancing market (EPRX) | Seven products, and prices by area

The balancing market is where grid operators buy the "capacity" to correct surpluses or shortages of electricity, every 30 minutes. Products are divided by how quickly output changes after an instruction. Primary reserve is the fastest and Tertiary reserve 2 is the slowest. Primary reserve has two categories. "Online" is connected to the grid operator by a dedicated line. "Offline" runs on the simplified dispatch system without a dedicated line. They are tendered and traded separately, so we show them separately. A Composite product is a bid that bundles several products. The price is set in yen per 1 kW of available capacity per 30 minutes. The figure shows the range of winning prices by area (by the area where the power source is). The thin line runs from the cheapest to the most expensive winning bid in the month. The thick band is the price range that holds 8 out of every 10 30-minute slots with winning bids. The dot is the average winning price. Nationwide figures are in the table in the "Market figures" section.

In the balancing market, the highest average winning price by area is Primary reserve (offline) in Tohoku at 14.49 yen. The lowest is Tertiary reserve 2 in Shikoku at 0.38 yen (yen/kW per 30 min).

Figure 6 Range and average of winning prices in the balancing market by area (July 2026 (1st to 31st), by area where the power source is)

Source: Trading results (preliminary figures) published by the Electric Power Reserve Exchange (EPRX). Our tally.

Product	Time from instruction to output change	Duration
Primary reserve (online)	Within 10 seconds	5 minutes or more
Primary reserve (offline)	Within 10 seconds	5 minutes or more
Secondary reserve 1	Within 5 minutes	30 minutes
Secondary reserve 2	Within 5 minutes	30 minutes
Tertiary reserve 1	Within 15 minutes	30 minutes
Tertiary reserve 2	Within 60 minutes	30 minutes
Composite product	Requirements of the combined products	Requirements of the combined products

8. ② Balancing market (EPRX) | Grid areas and times where bids win more easily

The clearing rate is the share of bid volume that won. The higher it is, the more easily bids win. The figure plots the clearing rate of each product by time of day (every 30 minutes), for each grid area (the area where the power source is). Where a line breaks, there were no bids at that time.

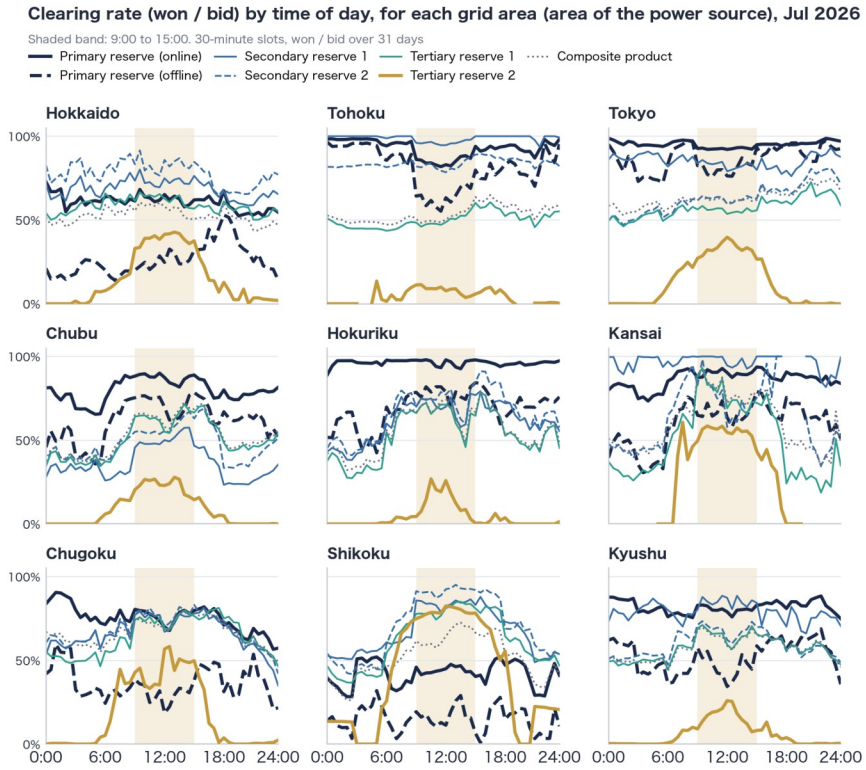

Figure 7 Clearing rate in the balancing market (grid area (area where the power source is) × time of day, July 2026 (1st to 31st))

Source: Trading results (preliminary figures) published by the Electric Power Reserve Exchange (EPRX). Our tally.

9. ② Balancing market (EPRX) | Primary reserve (online) turned into a contest for seats

Primary reserve is the fastest product. It changes output within 10 seconds of an instruction, and batteries are often used for it. The left shows the online category and the right the offline category. The bars are the bid ratio (bid volume ÷ volume tendered by the grid operators). Above 100%, more bids come in than are tendered, and some bids lose. The line is the average winning price. These are the monthly figures we have, starting from April 2025. Figures for Primary reserve (offline) start in April 2026.

In the balancing market, the bid ratio for Primary reserve (online) went above 100% in June 2026. This month it is 119.7%, with an average winning price of 4.35 yen. Primary reserve (offline) is at 65.1% and 10.25 yen (yen/kW per 30 min).

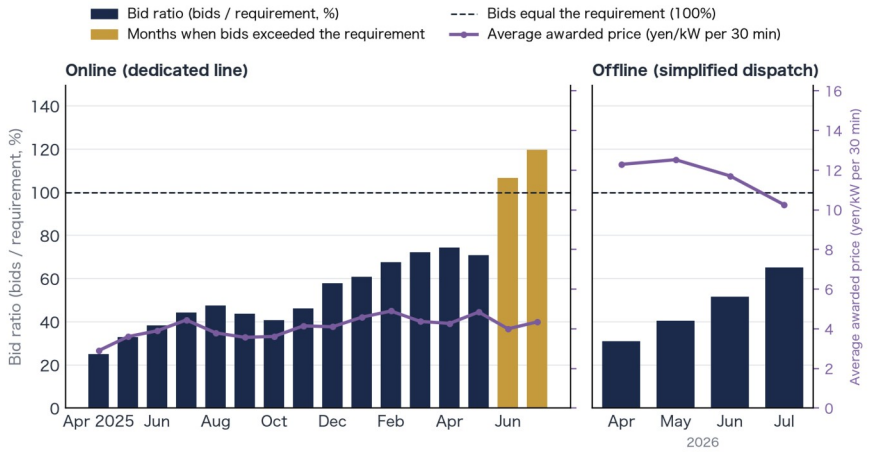

Figure 8 Bid ratio (bars) and average winning price (line) of Primary reserve (monthly; left is online, right is offline; gold bars are months when bids exceeded the tendered volume)

Source: Trading results (preliminary figures) published by the Electric Power Reserve Exchange (EPRX). Our tally.

10. ② Balancing market (EPRX) | How each product's price has moved

This is the average winning price of each product since April 2025 (monthly average weighted by winning volume). Figures for Primary reserve (offline) start in April 2026. From March 14, 2026, Primary reserve through Tertiary reserve 1 and Composite products moved from trading in 3-hour blocks to trading every 30 minutes (Tertiary reserve 2 was already traded every 30 minutes).

In the balancing market, the average winning price of Primary reserve (online) was 2.89 yen in April 2025 and 4.35 yen this month. The highest was 4.90 yen in February 2026 (yen/kW per 30 min).

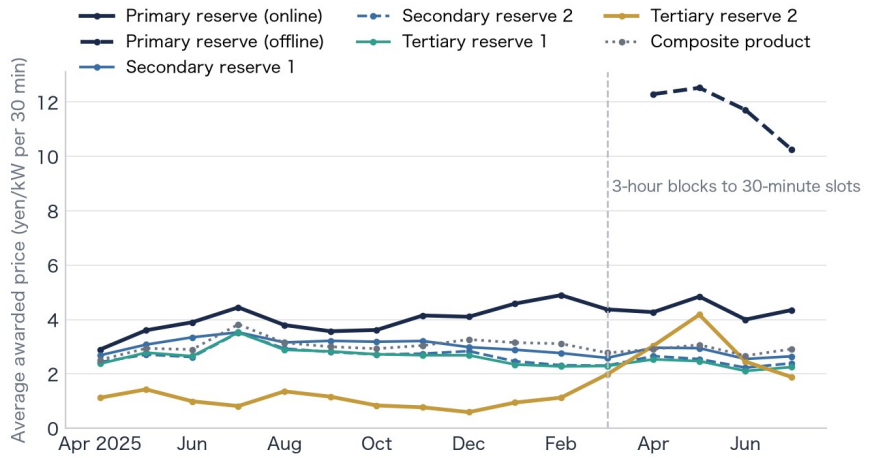

Figure 9 Average winning price by product in the balancing market (yen/kW per 30 min, monthly)

Source: Trading results (preliminary figures) published by the Electric Power Reserve Exchange (EPRX). Our tally.

© Science X Inc. · https://www.scix.co.jp

11. ② Balancing market (EPRX) | Which hours of the day are expensive

This is the average winning price of each product for each hour of the day, July 2026 (1st to 31st).

In the balancing market, the average winning price of Primary reserve (online) is highest around 18:00 at 6.07 yen and lowest around 3:00 at 3.44 yen (yen/kW per 30 min).

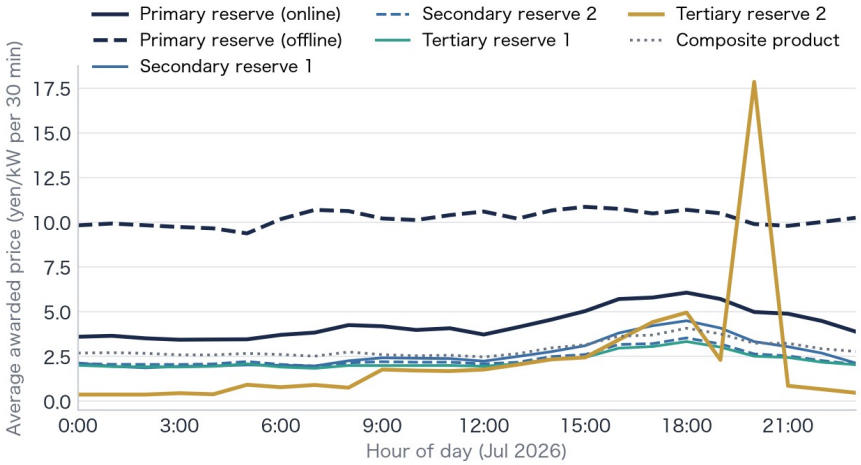

Figure 10 Average winning price by time of day in the balancing market (July 2026 (1st to 31st), yen/kW per 30 min)

Source: Trading results (preliminary figures) published by the Electric Power Reserve Exchange (EPRX). Our tally.

12. ② Balancing market (EPRX) | Which products batteries are used in

The figure shows the batteries' share of winning volume. The table compares the average winning price of the volume won by batteries with the average winning price of the whole product.

In the balancing market, batteries hold a 22.8% share of Primary reserve (online). The average winning price of the volume won by batteries is 8.50 yen, against 4.35 yen overall (yen/kW per 30 min).

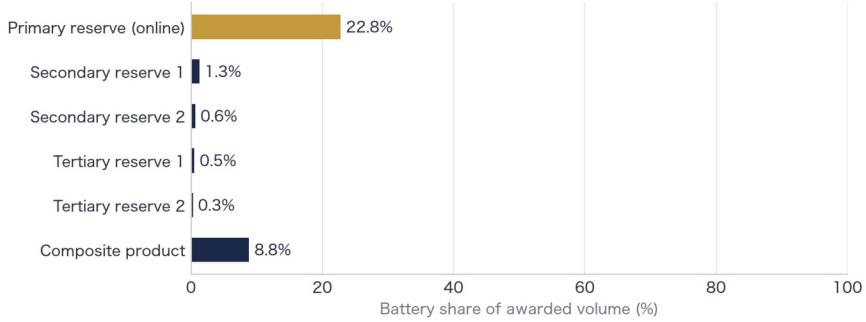

Figure 11 Share of batteries in the balancing market (%)

Source: Trading results (preliminary figures) by power source type, published by the Electric Power Reserve Exchange (EPRX). Our tally.

Product	Won by batteries (yen/kW per 30 min)	Whole product (yen/kW per 30 min)
Primary reserve (online)	8.50	4.35
Secondary reserve 1	5.52	2.65
Secondary reserve 2	4.47	2.39
Tertiary reserve 1	4.43	2.25
Tertiary reserve 2	51.97	1.88
Composite product	8.48	2.91

Both are averages weighted by winning volume (July 2026, preliminary figures, nationwide). Batteries hold only 0.3% of the winning volume of Tertiary reserve 2, and most of it was won in high-price 30-minute slots, so their average comes out high. Primary reserve (offline) is not in this table or the figure, because we have not included the published figures by power source type in our tally.

13. ② Balancing market (EPRX) | Sales concentrate in a small number of 30-minute slots

We ranked the month's 30-minute slots with winning bids by sales (average winning price × winning volume, nationwide), from highest to lowest. For each product, we then plotted what % of the month's sales the top slots account for. The further a curve bulges above the dotted line, the more sales concentrate in a few slots. Tertiary reserve 2 is a product that covers errors in forecasting renewable output caused by the weather. Its price is low in most 30-minute slots and high in only a few.

In the balancing market, the share of sales in the top 10% of 30-minute slots was 57.3% for Tertiary reserve 2 and 17.7% for Primary reserve (online).

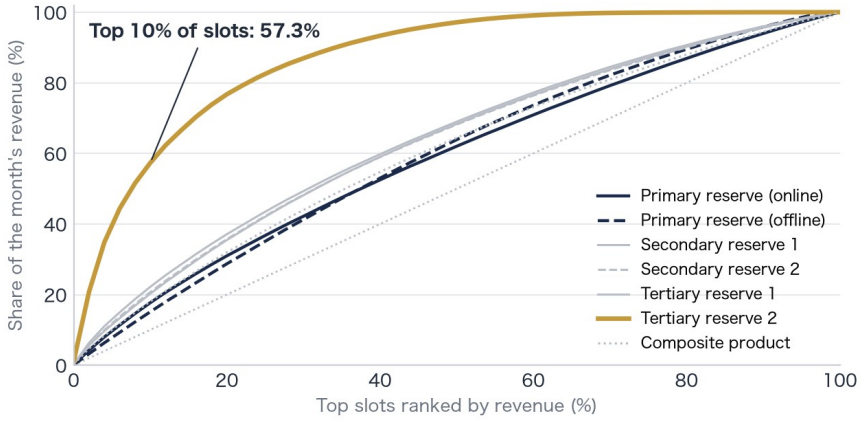

Figure 12 Share of balancing market sales in the top 30-minute slots (July 2026 (1st to 31st), nationwide)

Source: Trading results (preliminary figures) published by the Electric Power Reserve Exchange (EPRX). Our tally.

In July 2026, there were 1,188 30-minute slots with winning bids. The top 1% of them by sales (average winning price × winning volume) accounted for 10.6% of the month's sales. There were 39 slots with a nationwide average winning price of 10 yen/kW per 30 min or more, and 300 slots with no winning bids.

30-minute slots with the highest top winning prices (by area where the power source is):

Date	Time	Area	Highest winning price (yen/kW per 30 min)
July 11	9:00	Tokyo	97.00
July 11	9:30	Tokyo	97.00
July 11	10:00	Tokyo	97.00
July 11	10:30	Tokyo	97.00
July 15	9:00	Tokyo	97.00

Source: Tertiary reserve 2 trading results (preliminary figures) published by the Electric Power Reserve Exchange (EPRX). Our tally.

14. ③ Capacity market (OCCTO) | A market that buys future supply capacity

The capacity market buys electricity supply capacity 4 years ahead in a once-a-year auction. The price is set in yen per kW per year. The left figure shows clearing prices in past main auctions. The right figure shows the battery and pumped-hydro capacity that cleared in the Long-Term Decarbonization Power Source Auction (a separate auction that supports new builds such as batteries and pumped hydro). Results are published once a year, so they do not change every month. The latest is for delivery FY2029 (published January 2026).

In the capacity market (once a year, latest publication), the clearing price in Tokyo was 3,495 yen/kW for delivery FY2025 and 15,111 yen/kW for FY2029. In the Long-Term Decarbonization Power Source Auction, batteries and pumped hydro cleared 819 MW of lithium-ion and 886 MW of non-lithium in the FY2025 round.

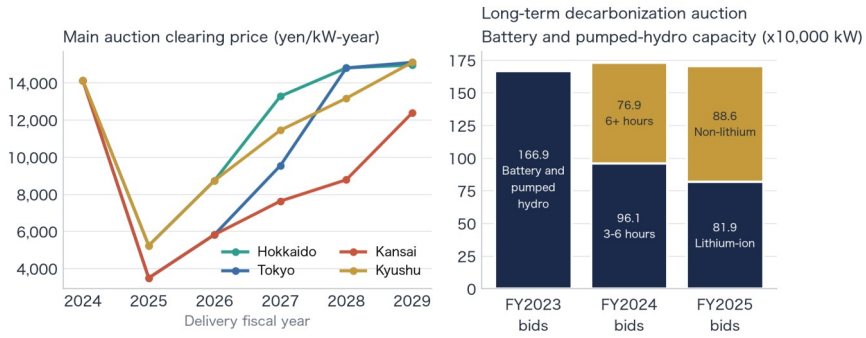

Figure 13 Capacity market clearing prices (left, yen/kW) and cleared battery and pumped-hydro capacity in the Long-Term Decarbonization Power Source Auction (right, in units of 10,000 kW)

Source: Clearing results and capacity securing contract documents published by the Organization for Cross-regional Coordination of Transmission Operators (OCCTO) (sources listed in the last section (Assumptions and terms)). As published.

15. Our records | Where battery storage projects are growing

We counted the projects newly listed this month on DealRoom (our data room for buyers, where we list battery storage projects), by the grid operator's grid area. These are figures for the projects we handled, not counts for the whole market. Transfer of rights is a sale that hands over the land and power rights. Completed-build handover is a sale that hands over the plant once it is built.

New listings on our DealRoom in July 2026 were 27 projects, 137.3 MW. By grid area, these include Chugoku with 4 projects, 91.4 MW; Tokyo with 12 projects, 23.9 MW; and Kyushu with 5 projects, 10.0 MW.

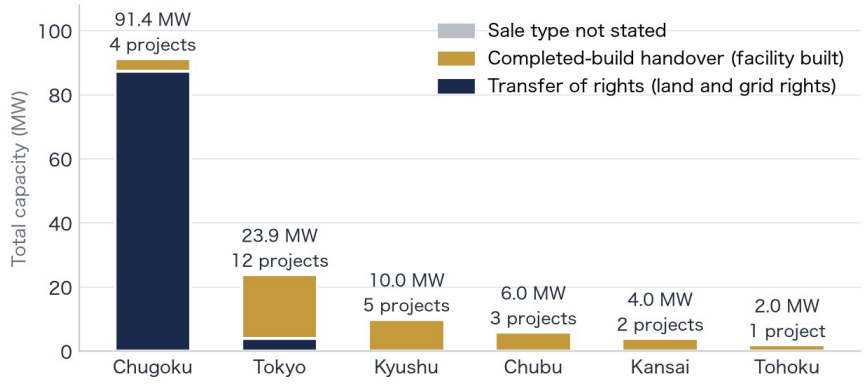

Figure 14 Output of projects listed on our DealRoom in July 2026 (MW)

Source: Our DealRoom records (project locations are shown only down to the grid area; prices and parties are not included).

16. Our records | How many months and how much it takes to connect to the grid

A grid connection study is the procedure where the grid operator checks "can this site connect, and how much will the work cost?" The grid connection cost contribution is the part of the connection work cost paid by the applicant. Of the response letters we received, we tallied only high-voltage cases (connecting to 6,600 V distribution lines), by grid area. Extra-high-voltage cases are not included. Grid areas with fewer than 5 cases are not shown.

Grid connection study responses (high voltage only, as of October 19, 2026): the median construction period ranges from 8.0 months in Tokyo to 17.0 months in Tohoku. The median grid connection cost contribution ranges from ¥3.02 million in Tokyo to ¥32.35 million in Tohoku.

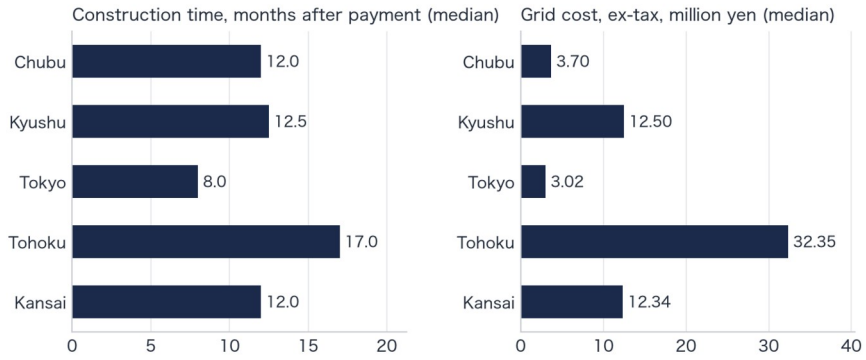

Figure 15 Median grid connection study responses (high voltage) by grid area (left: months of construction, right: grid connection cost contribution, excluding tax)

Source: Our tally of the high-voltage grid connection study response letters we received from general transmission and distribution operators (as of October 19, 2026).

17. Market figures (tables ready to use in your materials)

We put the figures behind the charts in this issue into tables you can use in your materials: ① wholesale electricity (JEPX) figures by area and trading volume, ② nationwide figures by product for the balancing market (bid ratio, clearing rate, price, battery share), and ③ capacity market clearing prices.

Wholesale electricity, JEPX spot market (July 2026, by area, yen/kWh)

Area	Monthly average	Same month last year	Daytime (8:00–16:00)	Evening (16:00–20:00)	4-hour gap	Highest	Slots at 30 yen or more	Slots at 0.01 yen
System (nationwide)	17.91	12.75	15.97	26.02	13.51	46.88	137	0
Hokkaido	14.32	13.11	10.57	22.58	15.86	45.01	67	6
Tohoku	17.98	13.00	15.06	25.96	15.20	50.01	102	3
Tokyo	19.86	13.88	19.75	26.70	13.17	50.01	150	0
Chubu	18.84	13.83	17.61	26.38	13.70	46.40	160	0
Hokuriku	17.26	13.37	16.67	24.78	13.65	46.40	151	0
Kansai	17.19	13.37	16.48	24.89	13.77	58.38	147	0
Chugoku	16.18	11.71	13.55	24.71	14.55	58.38	123	0
Shikoku	13.63	9.60	9.89	20.64	16.78	58.38	100	23
Kyushu	15.37	11.38	11.60	24.68	15.71	58.38	123	0

Trading volume (July 2026, total for 31 days): total cleared volume 37,697 million kWh (same month last year: 27,205 million kWh), sell bid volume 55,527 million kWh, buy bid volume 46,604 million kWh.

Source: Spot market trading results published by the Japan Electric Power Exchange (JEPX). Prices are simple averages of 30-minute slots. Our tally.

Balancing market (July 2026, preliminary figures, nationwide)

Product	Tendered volume (MW)	Bid volume (MW)	Winning volume (MW)	Bid ratio (bids ÷ tendered)	Clearing rate (won ÷ bids)	Average winning price (yen/kW per 30 min)	Battery share
Primary reserve (online)	1,408.5	1,685.7	1,334.8	119.7%	79.2%	4.35	22.8%
Primary reserve (offline)	495.7	322.7	207.7	65.1%	64.4%	10.25	—

Product	Tendered volume (MW)	Bid volume (MW)	Winning volume (MW)	Bid ratio (bids ÷ tendered)	Clearing rate (won ÷ bids)	Average winning price (yen/kW per 30 min)	Battery share
Secondary reserve 1	924.0	1,972.7	1,190.9	213.5%	60.4%	2.65	1.3%
Secondary reserve 2	831.0	3,496.6	2,139.8	420.8%	61.2%	2.39	0.6%
Tertiary reserve 1	2,455.6	5,280.7	2,922.3	215.0%	55.3%	2.25	0.5%
Tertiary reserve 2	333.0	1,561.8	329.6	469.0%	21.1%	1.88	0.3%
Composite product	3,290.1	5,975.8	3,459.0	181.6%	57.9%	2.91	8.8%

Volumes are averages per 30-minute slot. Products with a bid ratio under 100% did not get enough bids to cover the tendered volume. The clearing rate is the share of bid volume that won. The battery share for Primary reserve (offline) is "—" because we have not included the published figures by power source type in our tally.

Source: Trading results (preliminary figures) and trading results by power source type published by the Electric Power Reserve Exchange (EPRX). Our tally.

Capacity market main auction area prices (yen/kW per year)

18. Assumptions and terms

- The figures are our tally of the published figures in the sources. We have not added up several months or converted anything to annual figures. We do not show the earnings of any single battery storage plant.
- Months covered: wholesale electricity (JEPX) covers July 2026 (31 days). The balancing market (EPRX) covers the July 2026 preliminary figures (delivery dates up to the 31st). For the balancing market, the month differs until the published figures for July 2026 are included in the tally.
- Average prices are simple averages of 30-minute slots (not weighted by trading volume). Daytime means the 8:00–16:00 slots and evening means the 16:00–20:00 slots.
- Price gap: we rank the day's 30-minute slots by price and subtract the average of the 8 cheapest slots from the average of the 8 most expensive slots (4 hours) (4 slots for 2 hours). It ignores the order of the cheap and expensive hours, electricity lost in charging and discharging, and fees, taxes and grid usage charges. It does not show actual earnings.
- Balancing market: nationwide figures (total column) of the EPRX preliminary figures. Tendered volume is by grid operator (TSO). Bid volume, winning volume and average winning price are by area where the power source is. Volumes are averages per 30-minute slot. The average winning price is weighted by winning volume. Bid ratio = bid volume ÷ tendered volume; clearing rate = winning volume ÷ bid volume. The 3-hour blocks up to March 13, 2026 were counted as six 30-minute slots per block.
- Range of winning prices: the thin line runs from the cheapest bid (lowest winning price) to the most expensive bid (highest winning price) among the month's 30-minute slots with winning bids (published figures by area where the power source is). The published figures for Primary reserve (online), Secondary reserve 1 and 2 and Tertiary reserve 1 also include Composite product bids (one price for several bundled products). For this reason, we removed from the thin line any bids that can be explained by a Composite product bid in the same 30-minute slot and area. These are bids above the price cap of 15 yen (for deliveries up to August 31, 2026) for Primary reserve (online) and Secondary reserve 1, and bids above 10 yen for Secondary reserve 2 and Tertiary reserve 1. For Primary reserve (offline), we removed bids above the price cap (15 yen this month) from the thin line (the balancing market system also clears bids above the cap, then cuts them down to the cap at settlement). The thick band covers the 10% to 90% range when the average winning prices of slots with winning bids are ranked from lowest to highest. The dot is the average weighted by winning volume.
- Clearing rate by grid area × time of day: total winning volume ÷ total bid volume for the slots at the same time of day in the month (by area where the power source is).
- The time from instruction to output change and the duration for each balancing market product are the FY2026 specifications. The online category of Primary reserve is connected to the grid operator by a dedicated line. The offline category runs on the simplified dispatch system without a dedicated line.
- High-price 30-minute slots for Tertiary reserve 2: slots with a nationwide average winning price of 10 yen/kW per 30 min or more. The top 1% means the top 1% of slots when ranked by sales (average winning price × winning volume). The highest winning price is the published figure by area where the power source is.

- Capacity market clearing results for each delivery fiscal year were published in a different year (FY2024 in 2020, FY2029 in January 2026). We do not show the number of battery projects in the Long-Term Decarbonization Power Source Auction, because it is not in the published summary tables.

Sources: Japan Electric Power Exchange (JEPX) spot market trading results / Electric Power Reserve Exchange (EPRX) trading results (preliminary figures) and trading results by power source type / Organization for Cross-regional Coordination of Transmission Operators (OCCTO) capacity market main auction clearing results and Long-Term Decarbonization Power Source Auction capacity securing contract documents / our tally of the grid connection study response letters we received / our DealRoom records.

Terms: system price (System, nationwide) = the wholesale electricity price when all of Japan is treated as one market. Area price = a separate price for each area, set by how congested the power lines are. The grid = the power companies' transmission network. Grid

connection = connecting to the transmission network. MW = size of power (1 MW = 1,000 kW). MWh = amount of electricity that can be stored. yen/kWh = price per 1 kWh of electricity.
