ScienceX

Battery Storage Market Notes, August 2026 issue

Science X Inc. Published November 5, 2026

The price of electricity changes with the time of use. A "grid-scale battery" (a large battery connected to the power grid that stores electricity and releases it) earns money from that difference. These notes use published figures and our own records to show this month's trends in figures and tables. This issue is a back issue, prepared retroactively in November 2026. The grid connection study figures are as of the time of preparation (October 19, 2026).

1. Three revenue streams for a battery storage plant (how to read these notes)

A battery storage plant (grid-scale battery) earns revenue from three markets. ① Wholesale electricity (JEPX) is a market where you buy and store electricity when it is cheap and sell it when it is expensive. ② The balancing market (EPRX) is a market where you sell grid operators the "capacity" to correct surpluses or shortages of electricity. ③ The capacity market (OCCTO) is a market where the country buys future electricity supply capacity in advance. These notes present the figures in the order of these three markets. The ①②③ at the start of each section title shows which market it covers.

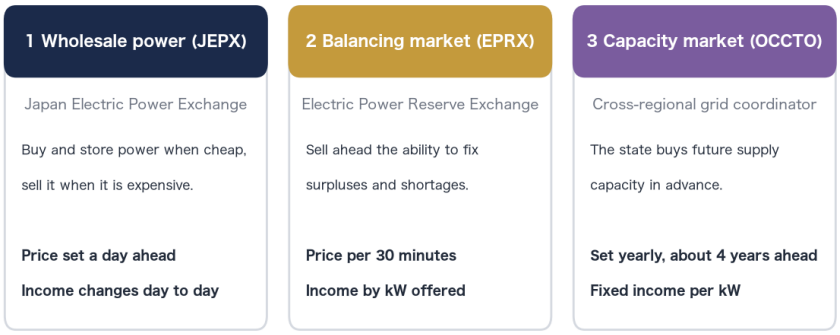

Figure 1 Three revenue streams for a battery storage plant

Source: Rules of the Japan Electric Power Exchange (JEPX), the Electric Power Reserve Exchange (EPRX) and the Organization for Cross-regional Coordination of Transmission Operators (OCCTO).

2. Three trends this month

We picked three trends this month from the figures of the three markets.

- In wholesale electricity (JEPX), the monthly average spread between the 4 most expensive hours and the 4 cheapest hours in August 2026 was 11.94 yen/kWh in Tokyo and 18.82 yen/kWh in Kyushu.
- In the balancing market (EPRX), the bid-to-procurement ratio for Primary reserve (online) was 106.8% in June 2026, exceeding 100% for the first time since April 2025. This month it was 116.0%, and the average winning price was 4.40 yen/kW per 30 min.
- In the balancing market (EPRX), 52.2% of Tertiary reserve 2 revenue in August 2026 was concentrated in the top 10% of 30-minute slots by revenue.

3. ① Wholesale electricity (JEPX) | Average price

Wholesale electricity is electricity bought and sold between power companies and retailers. Its price is set in the "spot market" of the Japan Electric Power Exchange (JEPX), a market where electricity for the next day is traded the day before. "System (nationwide)" is the price when all of Japan is treated as one market (the system price). When the transmission lines between regions are congested, the price splits by area from Hokkaido to Kyushu (area prices).

The average wholesale electricity price for System (nationwide) in August 2026 was 19.14 yen/kWh. In the same month last year it was 11.98 yen/kWh.

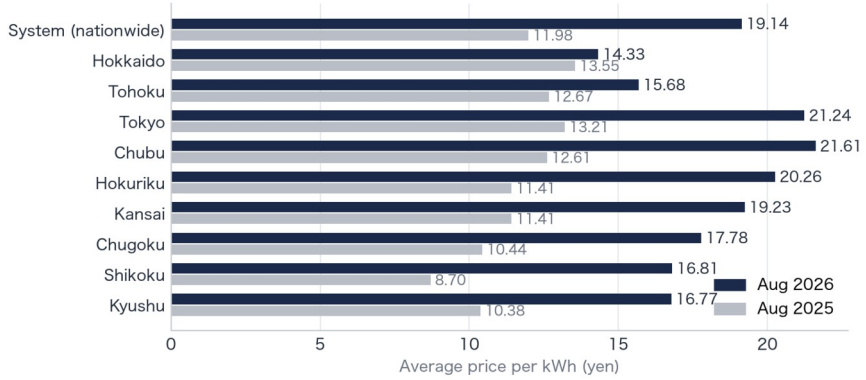

Figure 2 Average wholesale electricity price (yen/kWh). Navy is August 2026, grey is the same month last year

Source: Spot market trading results published by the Japan Electric Power Exchange (JEPX). Simple average of the price for each 30 minutes. Our tally.

4. ① Wholesale electricity (JEPX) | How the price moves during the day

The wholesale electricity price changes every 30 minutes. The figure shows the shape of a day, averaging the price at the same time of day across the month. If a battery stores electricity in cheap hours and releases it in expensive hours, the difference becomes its revenue.

The daily low of wholesale electricity was 17.32 yen/kWh around 6:30 in Tokyo and 10.55 yen/kWh around 12:00 in Kyushu. The daily peak was 28.06 yen/kWh around 17:30 in Tokyo and 30.21 yen/kWh around 18:00 in Kyushu.

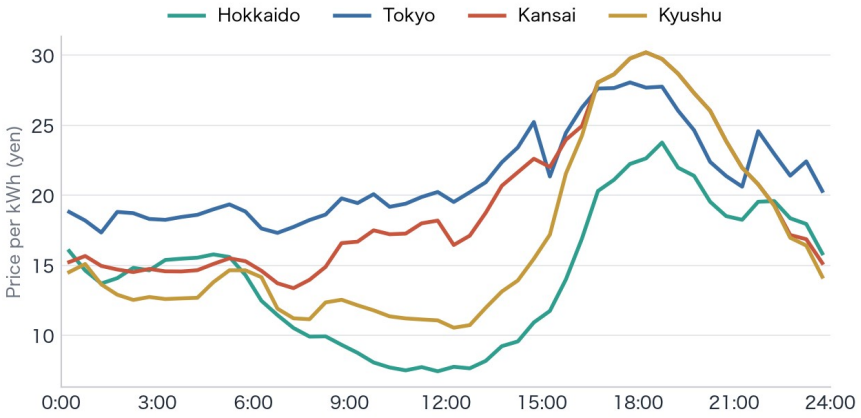

Figure 3 Daily peak and low of the wholesale electricity price (August 2026 average, yen/kWh)

Source: JEPX spot market. Our tally.

5. ① Wholesale electricity (JEPX) | How large is the spread per kWh

We took the average price of the 4 most expensive hours of each day, subtracted the average price of the 4 cheapest hours, and listed the monthly average by area. This equals the difference per kWh when you buy 1 kWh in the 4 cheapest hours and sell it in the 4 most expensive hours. It is a simple difference: it does not subtract electricity lost in charging and discharging or fees, and it ignores the order of the cheap and expensive hours.

The monthly average spread between the 4 most expensive hours and the 4 cheapest hours of wholesale electricity was largest in Shikoku at 19.67 yen/kWh and smallest in Tokyo at 11.94 yen/kWh.

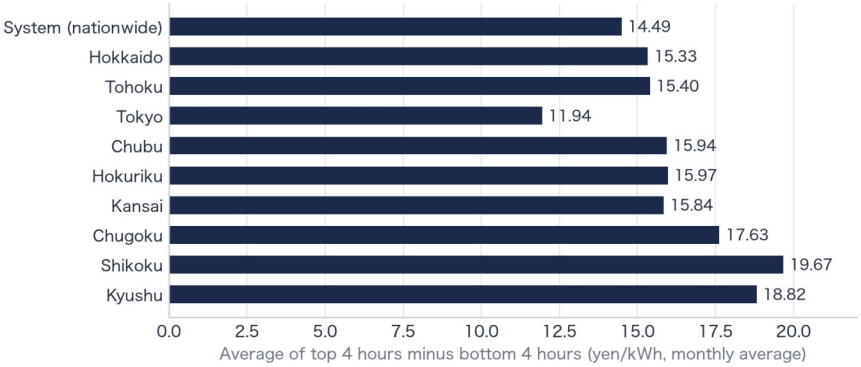

Figure 4 Wholesale electricity spread: average of the 4 most expensive hours − average of the 4 cheapest hours (August 2026, yen/kWh, monthly average)

Source: JEPX spot market. Our tally.

Area	2-hour spread (yen/kWh)	4-hour spread (yen/kWh)	Days with a 4-hour spread of 10 yen or more
System (nationwide)	16.09	14.49	26
Hokkaido	17.04	15.33	25
Tohoku	17.10	15.40	25
Tokyo	13.58	11.94	21
Chubu	17.46	15.94	29
Hokuriku	17.89	15.97	24
Kansai	17.56	15.84	23
Chugoku	19.62	17.63	24
Shikoku	22.29	19.67	27

Area	2-hour spread (yen/kWh)	4-hour spread (yen/kWh)	Days with a 4-hour spread of 10 yen or more
Kyushu	20.53	18.82	24

The spread is the monthly average of the daily spreads. August 2026 covers 31 days.

6. ① Wholesale electricity (JEPX) | There is a spread every day

We listed the same 4-hour spread day by day. The larger the spread on a day, the more room a battery has to earn from it.

Out of 31 days, the 4-hour spread of wholesale electricity was 10 yen/kWh or more on 26 days for System (nationwide), 29 days in Chubu and 21 days in Tokyo.

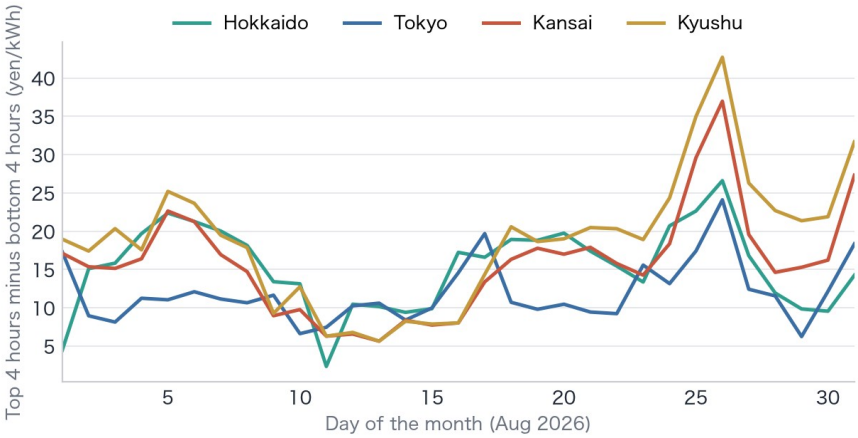

Figure 5 Daily wholesale electricity spread (average of the day's 4 most expensive hours − average of the 4 cheapest hours, yen/kWh)

Source: JEPX spot market. Our tally.

7. ② Balancing market (EPRX) | Seven products, and prices by area

The balancing market is a market where grid operators buy, every 30 minutes, the "capacity" to correct surpluses or shortages of electricity. The products are divided by how fast output changes after a dispatch instruction. Primary reserve is the fastest and Tertiary reserve 2 is the slowest. Primary reserve has two categories: "online", connected to the grid operator by a dedicated line, and "offline", which runs on the simplified dispatch system without a dedicated line. They are procured and traded separately, so we show them separately. A Composite product is a bid that offers several products together. The price is set in yen per 1 kW of capacity offered per 30 minutes. The figure shows the range of winning prices by area (by the area where the resource is located). The thin line runs from the cheapest to the most expensive bid in the month, the thick band is the price range that contains 8 out of 10 slots with awards, and the dot is the average winning price. Nationwide figures are in the table in the "Market figures" section.

By area, the average winning price in the balancing market was highest for Primary reserve (offline) in Tohoku at 14.52 yen/kW per 30 min and lowest for Tertiary reserve 2 in Shikoku at 0.38 yen/kW per 30 min.

Figure 6 Range and average of winning prices in the balancing market by area (August 2026 (1st to 31st), by area where the resource is located)

Source: Trading results (preliminary) published by the Electric Power Reserve Exchange (EPRX). Our tally.

Product	Time from instruction to output change	Duration
Primary reserve (online)	Within 10 seconds	5 minutes or more
Primary reserve (offline)	Within 10 seconds	5 minutes or more
Secondary reserve 1	Within 5 minutes	30 minutes
Secondary reserve 2	Within 5 minutes	30 minutes
Tertiary reserve 1	Within 15 minutes	30 minutes
Tertiary reserve 2	Within 60 minutes	30 minutes
Composite product	Requirements of the combined products	Requirements of the combined products

8. ② Balancing market (EPRX) | Grid areas and times where bids win more easily

The award rate is the share of the bid volume that was awarded. The higher it is, the more easily bids win. The figure shows, for each grid area (the area where the resource is located), the award rate of each product by time of day (every 30 minutes). Where a line is broken, there were no bids at that time.

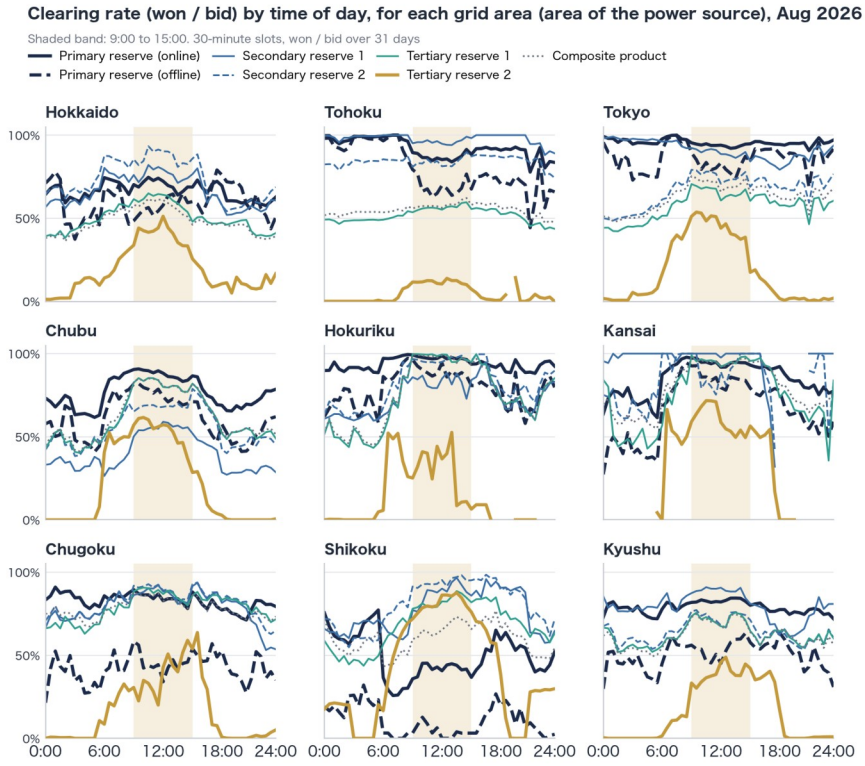

Figure 7 Award rate in the balancing market (grid area (where the resource is located) × time of day, August 2026 (1st to 31st))

Source: Trading results (preliminary) published by the Electric Power Reserve Exchange (EPRX). Our tally.

9. ② Balancing market (EPRX) | Primary reserve (online) became a contest for seats

Primary reserve is the fastest product, changing output within 10 seconds of an instruction, and batteries are often used for it. The left side is the online category and the right side is the offline category. The bars show the bid-to-procurement ratio (bid volume ÷ volume procured by grid operators). Above 100%, more bids come in than the procured volume, and some bids lose. The line shows the average winning price. These are monthly figures from April 2025, the data we have. Primary reserve (offline) figures start in April 2026.

In the balancing market, the bid-to-procurement ratio for Primary reserve (online) exceeded 100% in June 2026. This month it is 116.0%, with an average winning price of 4.40 yen/kW per 30 min. Primary reserve (offline) was 73.4% and 9.63 yen/kW per 30 min.

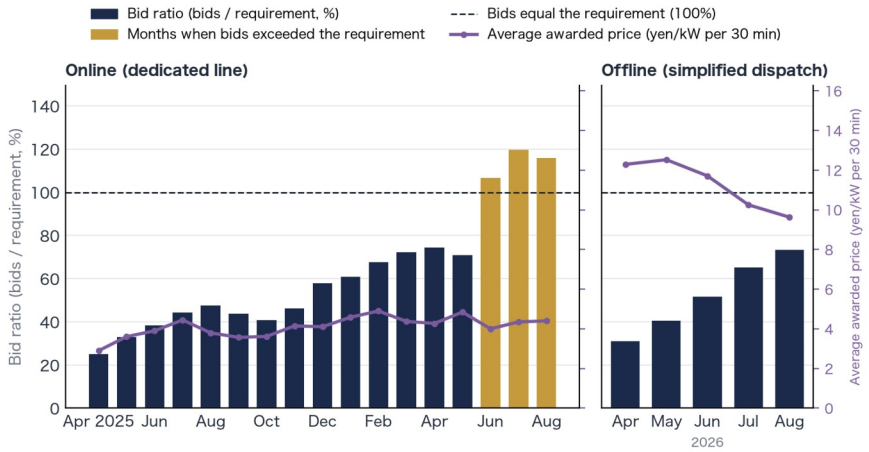

Figure 8 Bid-to-procurement ratio (bars) and average winning price (line) for Primary reserve (monthly. Left is online, right is offline. Gold bars are months when bids exceeded the procured volume)

Source: Trading results (preliminary) published by the Electric Power Reserve Exchange (EPRX). Our tally.

10. ② Balancing market (EPRX) | How prices have moved by product

This is the average winning price by product since April 2025 (monthly average weighted by awarded volume). Primary reserve (offline) figures start in April 2026. From March 14, 2026, Primary to Tertiary reserve 1 and the Composite product changed from trading every 3 hours to trading every 30 minutes (Tertiary reserve 2 was already every 30 minutes).

In the balancing market, the average winning price of Primary reserve (online) went from 2.89 yen in April 2025 to 4.40 yen this month (the highest was 4.90 yen in February 2026), and Tertiary reserve 2 went from 1.12 yen to 2.03 yen (the highest was 4.18 yen in May 2026) (yen/kW per 30 min).

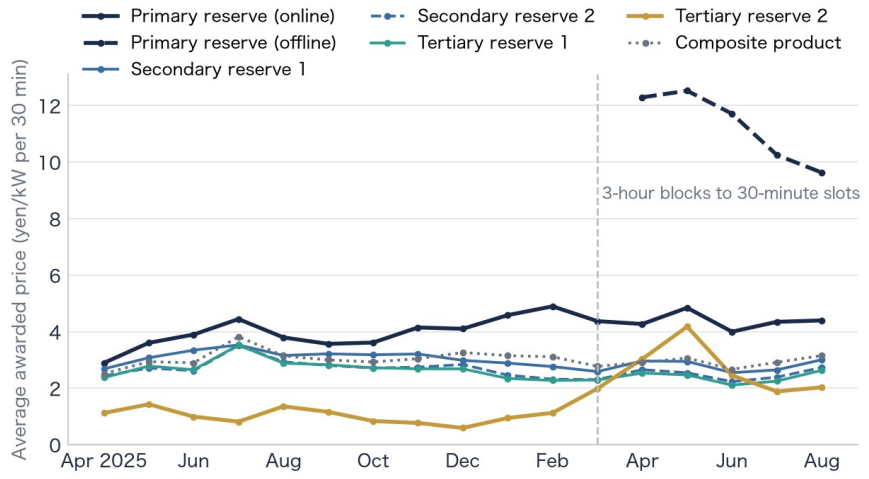

Figure 9 Average winning price by product in the balancing market (yen/kW per 30 min, monthly)

Source: Trading results (preliminary) published by the Electric Power Reserve Exchange (EPRX). Our tally.

11. ② Balancing market (EPRX) | Which hours of the day are expensive

This is the hourly average winning price by product for August 2026 (1st to 31st).

In the balancing market, the average winning price of Primary reserve (online) was highest around 18:00 at 5.53 yen and lowest around 0:00 at 3.50 yen. Tertiary reserve 2 was 4.40 yen around 17:00 and 0.41 yen around 1:00 (yen/kW per 30 min).

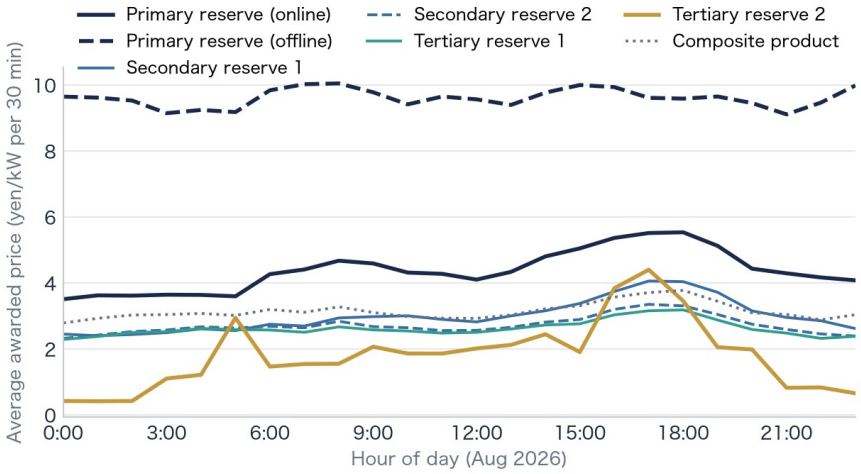

Figure 10 Average winning price by time of day in the balancing market (August 2026 (1st to 31st), yen/kW per 30 min)
Source: Trading results (preliminary) published by the Electric Power Reserve Exchange (EPRX). Our tally.

12. ② Balancing market (EPRX) | Which products batteries are used for

The figure shows the share of awarded volume taken by batteries. The table compares the average winning price of the volume won by batteries with the average winning price of the whole product.

In the balancing market, batteries held a 24.4% share of Primary reserve (online). The average winning price of the volume won by batteries was 8.08 yen/kW per 30 min, against 4.40 yen/kW per 30 min overall.

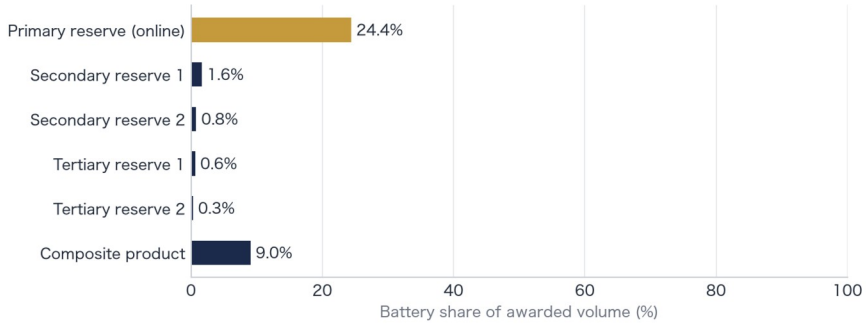

Figure 11 Share of batteries in the balancing market (%)
Source: Trading results (preliminary) by resource type published by the Electric Power Reserve Exchange (EPRX). Our tally.

Product	Volume won by batteries (yen/kW per 30 min)	Whole product (yen/kW per 30 min)
Primary reserve (online)	8.08	4.40
Secondary reserve 1	5.14	3.01
Secondary reserve 2	4.08	2.73
Tertiary reserve 1	4.03	2.63
Tertiary reserve 2	51.66	2.03
Composite product	8.02	3.15

Both are averages weighted by awarded volume (August 2026, preliminary, nationwide). For Tertiary reserve 2, batteries account for only 0.3% of awarded volume, and most of it was won in high-priced slots, so their average comes out high. Primary reserve (offline) is not shown in this table or figure, because the published figures by resource type are not included in our tally.

13. ② Balancing market (EPRX) | Revenue is concentrated in a small number of slots

We sorted the month's 30-minute slots with awards by revenue (average winning price × awarded volume, nationwide), from highest to lowest, and plotted for each product what % of the month's revenue the top slots account for. The more a curve bulges above the dotted line, the more revenue is concentrated in a few slots. Tertiary reserve 2 is a product that covers errors in forecasting renewable output caused by the weather. Its price is low in most slots and high in only a few.

In the balancing market, the share of revenue concentrated in the top 10% of slots was 52.2% for Tertiary reserve 2 and 15.5% for Primary reserve (online).

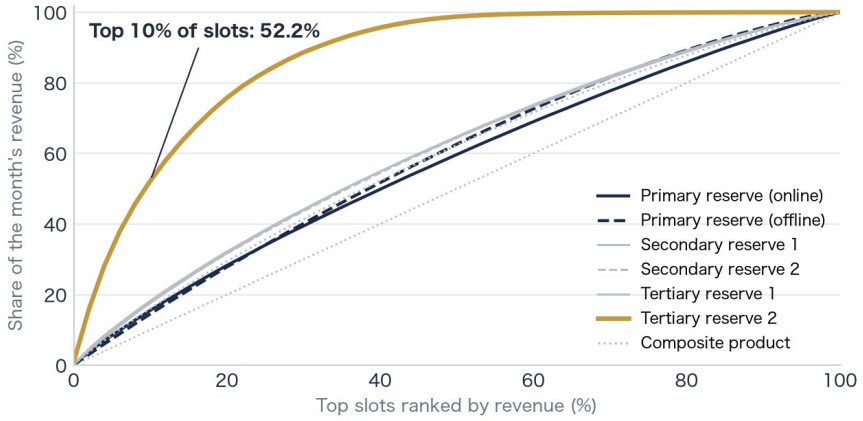

Figure 12 Share of balancing market revenue concentrated in the top slots (August 2026 (1st to 31st), nationwide)

Source: Trading results (preliminary) published by the Electric Power Reserve Exchange (EPRX). Our tally.

In August 2026, of the 1,345 slots with awards, the top 1% of slots by revenue (average winning price × awarded volume) accounted for 8.4% of the month's revenue. There were 34 slots with a nationwide average winning price of 10 yen/kW per 30 min or more, and 143 slots with no awards.

Slots with the highest maximum winning prices (by area where the resource is located):

Date	Time	Area	Maximum winning price (yen/kW per 30 min)
August 6	9:00	Tokyo	97.00
August 6	9:30	Tokyo	97.00
August 6	10:00	Tokyo	97.00
August 6	11:00	Tokyo	97.00
August 9	9:00	Tokyo	97.00

Source: Tertiary reserve 2 trading results (preliminary) published by the Electric Power Reserve Exchange (EPRX). Our tally.

14. ③ Capacity market (OCCTO) | A market that buys future supply capacity

The capacity market is a market that buys electricity supply capacity 4 years ahead through an auction once a year. The price is set in yen per kW per year. The left figure shows the clearing prices of past main auctions. The right figure shows the battery and pumped hydro capacity contracted in the Long-Term Decarbonization Power Source Auction (a separate auction that supports new builds such as batteries and pumped hydro). Results are published once a year, so they do not change every month. The latest is for delivery FY2029 (published January 2026).

The capacity market clearing price in Tokyo was 14,137 yen/kW for delivery FY2024, 3,495 yen/kW for FY2025 and 15,111 yen/kW for FY2029. In the Long-Term Decarbonization Power Source Auction, batteries and pumped hydro in the FY2025 round were 819 MW for lithium-ion and 886 MW for non-lithium (the latest annual publication).

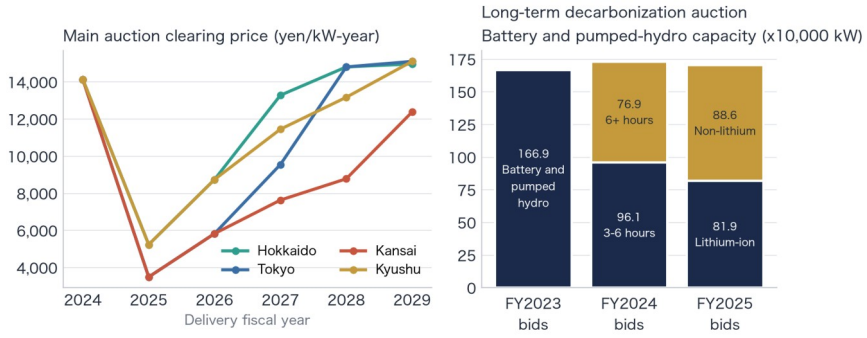

Figure 13 Capacity market clearing price (left, yen/kW) and battery and pumped hydro capacity contracted in the Long-Term Decarbonization Power Source Auction (right, in units of 10,000 kW)

Source: Clearing results and capacity assurance contract documents published by the Organization for Cross-regional Coordination of Transmission Operators (OCCTO) (sources listed in the last section (Assumptions and terms)). As published.

15. Our records | Where battery storage projects are increasing

We counted the projects newly listed this month on our DealRoom (our data room for buyers, a site where we list battery storage projects for buyers) by grid area of the grid operator. These are figures for projects we handled, not counts for the whole market. Transfer of rights is a sale that hands over the land and grid rights. Completed-build handover is a sale that hands over the plant once it is built.

New listings on our DealRoom in August 2026 were 17 projects, 175.6 MW. By grid area: Kyushu 6 projects, 105.6 MW; Tokyo 1 project, 50.0 MW; Chugoku 5 projects, 10.0 MW; Chubu 4 projects, 8.0 MW; Kansai 1 project, 2.0 MW.

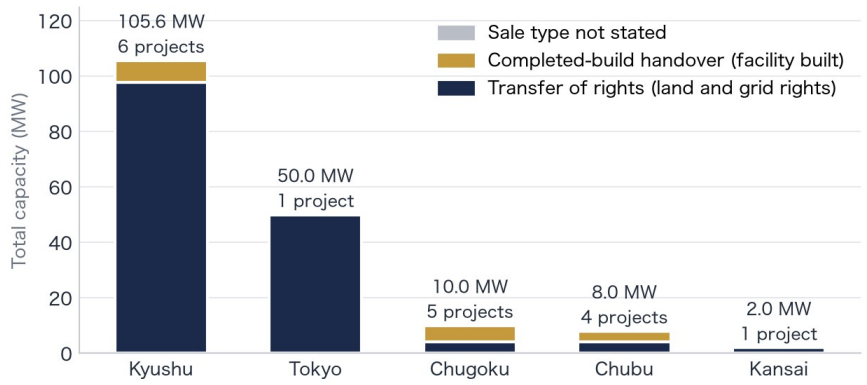

Figure 14 Output of projects listed on our DealRoom in August 2026 (MW)

Source: Our DealRoom records (project locations are shown only down to grid area; prices and parties are not listed).

16. Our records | How many months and how much it costs to connect to the grid

A grid connection study is a procedure in which the grid operator checks "whether a site can connect and how much the work will cost". The grid connection cost contribution is the part of the connection work cost paid by the applicant. Of the responses we received, we tallied only the high-voltage ones (connecting to 6,600 V distribution lines) by grid area. Extra-high voltage is not included. Grid areas with fewer than 5 responses are not shown.

In the grid connection study responses (high voltage only, as of October 19, 2026), the median construction period ranged from 8.0 months in Tokyo to 17.0 months in Tohoku, and the median grid connection cost contribution from ¥3.02 million in Tokyo to ¥32.35 million in Tohoku.

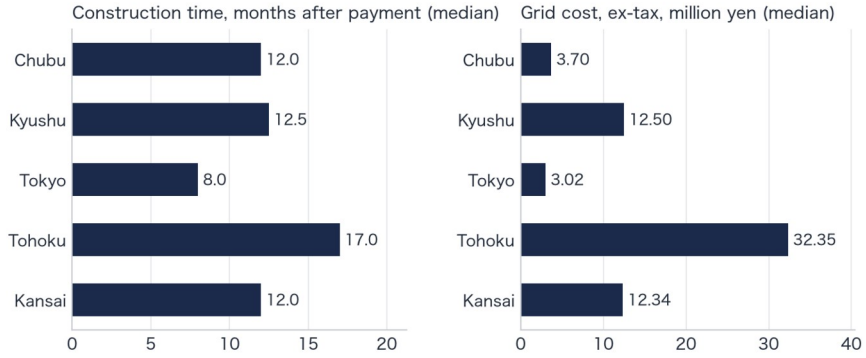

Figure 15 Median of grid connection study responses (high voltage) by grid area (left: months of construction, right: grid connection cost contribution, excluding tax)

Source: Tally of the high-voltage grid connection study responses from general transmission and distribution operators that we received (as of October 19, 2026).

17. Market figures (tables ready to use in your materials)

We put the figures behind the charts in tables so you can use them in your materials. ① Wholesale electricity (JEPX) figures and trading volume by area, ② nationwide balancing market figures by product (bid-to-procurement ratio, award rate, price, battery share), and ③ capacity market clearing prices.

Wholesale electricity, JEPX spot market (August 2026, by area, yen/kWh)

Area	Monthly average	Same month last year	Daytime (8:00–16:00)	Evening (16:00–20:00)	4-hour spread	Highest	Slots at 30 yen or more	Slots at 0.01 yen
System (nationwide)	19.14	11.98	16.72	27.60	14.49	50.01	127	0
Hokkaido	14.33	13.55	9.09	21.29	15.33	47.50	34	16
Tohoku	15.68	12.67	10.21	22.55	15.40	47.50	35	0
Tokyo	21.24	13.21	20.88	26.97	11.94	50.01	141	0
Chubu	21.61	12.61	20.00	30.10	15.94	55.23	253	0
Hokuriku	20.26	11.41	19.52	28.82	15.97	55.23	221	0
Kansai	19.23	11.41	18.72	28.42	15.84	55.23	179	0
Chugoku	17.78	10.44	14.41	28.39	17.63	55.23	145	0
Shikoku	16.81	8.70	12.12	27.65	19.67	55.23	141	10
Kyushu	16.77	10.38	13.01	28.33	18.82	55.23	143	0

Trading volume (August 2026, total for 31 days): total cleared volume 38,580 million kWh (same month last year 26,819 million kWh), sell bid volume 58,644 million kWh, buy bid volume 48,003 million kWh.

Source: Spot market trading results published by the Japan Electric Power Exchange (JEPX). Prices are simple averages of 30-minute slots. Our tally.

Balancing market (August 2026, preliminary, nationwide)

Product	Procured volume (MW)	Bid volume (MW)	Awarded volume (MW)	Bid-to-procurement ratio (bids ÷ procured)	Award rate (awarded ÷ bids)	Average winning price (yen/kW per 30 min)	Battery share
Primary reserve (online)	1,507.8	1,748.3	1,417.9	116.0%	81.1%	4.40	24.4%
Primary reserve (offline)	497.4	365.0	238.2	73.4%	65.3%	9.63	—

Product	Procured volume (MW)	Bid volume (MW)	Awarded volume (MW)	Bid-to-procurement ratio (bids ÷ procured)	Award rate (awarded ÷ bids)	Average winning price (yen/kW per 30 min)	Battery share
Secondary reserve 1	1,180.9	1,838.8	1,243.4	155.7%	67.6%	3.01	1.6%
Secondary reserve 2	973.0	3,690.2	2,501.1	379.3%	67.8%	2.73	0.8%
Tertiary reserve 1	2,963.3	5,474.0	3,279.9	184.7%	59.9%	2.63	0.6%
Tertiary reserve 2	484.1	1,422.5	459.0	293.8%	32.3%	2.03	0.3%
Composite product	3,783.2	6,207.0	3,871.6	164.1%	62.4%	3.15	9.0%

Volumes are averages per 30-minute slot. For products with a bid-to-procurement ratio below 100%, bids fall short of the procured volume. The award rate is the share of the bid volume that was awarded. The battery share for Primary reserve (offline) is "—" because the published figures by resource type are not included in our tally.

Source: Trading results (preliminary) and trading results by resource type published by the Electric Power Reserve Exchange (EPRX). Our tally.

Capacity market main auction area prices (yen/kW per year)

Delivery fiscal year	Hokkaido	Tohoku	Tokyo	Chubu	Hokuriku	Kansai	Chugoku	Shikoku	Kyushu
FY2024	14,137	14,137	14,137	14,137	14,137	14,137	14,137	14,137	14,137

18. Assumptions and terms

- The figures are our tally of the values published by the sources. We do not add up several months or convert to annual amounts. We do not show revenue amounts for any single battery storage plant.
- Months covered: wholesale electricity (JEPX) is August 2026 (31 days), and the balancing market (EPRX) is August 2026 preliminary data (delivery dates up to the 31st). For the balancing market, the month may differ until the published figures for August 2026 are included in our tally.
- Average prices are simple averages of 30-minute slots (not weighted by trading volume). Daytime is the slots from 8:00 to 16:00, and evening is the slots from 16:00 to 20:00.
- Spread: we sort the day's 30-minute slots by price and subtract the average of the cheapest 8 slots from the average of the most expensive 8 slots (4 hours) (4 slots for 2 hours). We do not account for the order of the cheap and expensive hours, electricity lost in charging and discharging, or fees, taxes and transmission charges. It does not represent actual revenue.
- Balancing market: nationwide (total column) of EPRX preliminary data. Procured volume is by grid operator (TSO); bid volume, awarded volume and average winning price are by area where the resource is located. Volumes are averages per 30-minute slot. The average winning price is weighted by awarded volume. Bid-to-procurement ratio = bid volume ÷ procured volume; award rate = awarded volume ÷ bid volume. For the 3-hour blocks up to March 13, 2026, we counted 1 block as 6 slots of 30 minutes.
- Winning price range: the thin line runs from the cheapest bid (minimum winning price) to the most expensive bid (maximum winning price) among the month's slots with awards (published values by area where the resource is located). The published values for Primary reserve (online), Secondary reserve 1 and 2, and Tertiary reserve 1 also include Composite product bids (one price for several products bundled together). So we removed from the thin line the bids above the price cap of 15 yen for Primary reserve (online) and Secondary reserve 1 (for delivery up to August 31, 2026), and above 10 yen for Secondary reserve 2 and Tertiary reserve 1, where they can be explained by a Composite product bid in the same slot and area. For Primary reserve (offline), we removed from the thin line the bids above the price cap (15 yen this month) (the balancing market system also clears bids above the cap and cuts them down to the cap at settlement). The thick band is the range from 10% to 90% from the bottom when the average winning prices of slots with awards are sorted from cheapest. The dot is the average weighted by awarded volume.
- Award rate by grid area × time of day: total awarded volume ÷ total bid volume for the slots at the same time of day across the month (by area where the resource is located).
- For balancing market products, the time from instruction to output change and the duration are the FY2026 specifications. The online category of Primary reserve is connected to the grid operator by a dedicated line, and the offline category runs on the simplified dispatch system without a dedicated line.
- High-priced slots for Tertiary reserve 2: slots with a nationwide average winning price of 10 yen/kW per 30 min or more. The top 1% is the top 1% of slots sorted by revenue (average winning price × awarded volume). The maximum winning price is the published value by area where the resource is located.

- Capacity market clearing results are published in different years for each delivery fiscal year (FY2024 in 2020, FY2029 in January 2026). We do not show the number of battery projects in the Long-Term Decarbonization Power Source Auction, because it is not in the published summary tables.

Sources: Japan Electric Power Exchange (JEPX) spot market trading results / Electric Power Reserve Exchange (EPRX) trading results (preliminary) and trading results by resource type / Organization for Cross-regional Coordination of Transmission Operators (OCCTO) capacity market main auction clearing results and Long-Term Decarbonization Power Source Auction capacity assurance contract documents / our tally of grid connection study responses we received / our DealRoom records.

Terms: system price (System, nationwide) = the wholesale electricity price when all of Japan is treated as one market. Area price = the price split by area due to transmission line congestion. The grid = the power companies' transmission network. Grid connection =

connecting to the transmission network. MW = a measure of power (1 MW = 1,000 kW). MWh = the amount of electricity that can be stored. yen/kWh = the price per 1 kWh of electricity.
